Writing Like Tame Impala: Parallel-Minor Mixture, Suspended Dominants, and the Psychedelic Major

Brandon Page

Copyright © 2026 Brandon Page. All rights reserved.

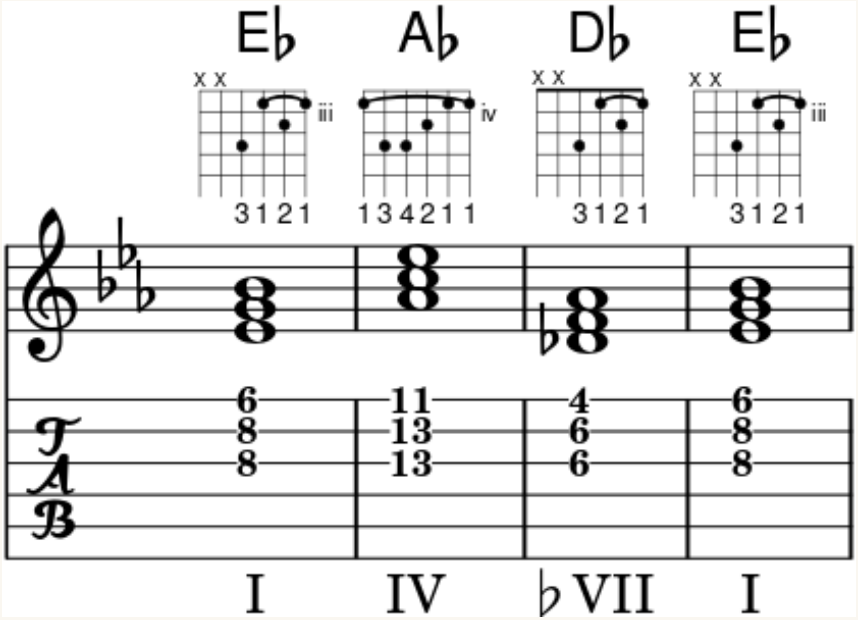
Counting method and data sources: Cadence counts (authentic, half, deceptive, plagal) were produced by the `music21-bar-harmony` analyzer (`~/.claude/skills/music21-bar-harmony/analyze.py`) running against MIDI chord files generated by `audio_to_chords.py` (librosa-based headless chord detection). Chord detection used the `~/venvs/audio_midi_311/bin/python` environment. All key centers were manually verified against the dominant chord in each song's sequence and corrected where the automatic Krumhansl detector produced flat-side bias. Corrected key assignments are documented in `source-texts/slow-rush-key-table.md`. Density counts (events per bar) were drawn from MIDI fresh-ear analysis files. All statistics cited in this book refer to filtered counts

(HC_filtered) rather than raw counts (V_raw) unless otherwise specified.

02

Introduction: Tame Impala and the Grammar of Borrowed Light

The opening chord of "One More Year" is E-flat major. The second chord is A-flat major. The third chord is D-flat major. This is the I–IV–bVII progression in E-flat major, and it establishes in three chords everything you need to know about how Kevin Parker writes harmony. The tonic is present. The subdominant follows it. The chord a whole step below the tonic, the flat seventh degree chord, borrowed from the parallel Mixolydian mode, arrives where the dominant should be. The dominant, E-flat major's V chord (B-flat major), appears briefly, but the progression does not cadence through it to resolve. It slides back to the flat seventh instead. The authentic V to I cadence never lands. The song ends as it began, in suspended major tonality with a flat seventh chord where the resolution should be.



Example 1.1, "One More Year": the I–IV–♭VII–I loop in E♭ major. The phrase settles on ♭VII (D♭) where a dominant would resolve.

Across twelve songs on *The Slow Rush*, this harmonic pattern repeats with a consistency that constitutes compositional style rather than habit. The bVII chord is Tame Impala's primary harmonic event, the move that defines the album's gravitational center. Chord detection analysis run across the full album confirms its dominance: on "One More Year," the bVII (D-flat in E-flat major) accounts for more time-on-chord than any chord except the tonic and subdominant. On "Breathe Deeper" (G major), the borrowed A major chord, functioning as a secondary dominant to the subdominant, appears alongside parallel-minor borrowings from C minor. On "Lost In Yesterday" (C-sharp/D-flat major), the B natural chord functions as the bVII within the C-sharp major key, arriving at every phrase ending with the same suspended quality that D-flat major provides in "One More Year." This is not a one-song device. It is an album-wide harmonic grammar.

<!-- /visual:SCALE_DEGREE_MAP@page-0 -->

The theoretical framework for this grammar comes from two sources. The first is Piston's analysis of **modal mixture chords** in *Harmony*, where mixture is defined as the borrowing of chords from the parallel mode, chords built on the same root scale degrees as the original mode but using the intervals of the parallel mode. In C major, the parallel minor mode (C natural minor, or C Aeolian) provides the bVII (B-flat major), the bVI (A-flat major), and the bIII (E-flat major). These mixture chords create a darkening effect within a nominally major-key context: the tonic stays major, but borrowed chords from the parallel minor pull the harmony toward minor-mode weight without fully modulating. Parker uses all three of these borrowings on *The Slow Rush*. The bVII appears on every track. The bVI appears explicitly on "Posthumous Forgiveness," where an E-flat major chord enters in a G major context (the flat sixth of G is E-flat) and functions as the album's most emotionally weighted harmonic event. The bIII appears in transitional passages on "Borderline," where the borrowing creates a chromatic third-relationship between the tonic chord and the flat mediant.

Example 1.2, Parallel-minor ♭VI: E♭ major borrowed into G major ("Posthumous Forgiveness").

The second source is Schoenberg's account of **vagrant harmonies** in *Structural Functions of Harmony*. Schoenberg describes vagrant harmonies as chords that cannot be assigned to a single tonal context, chords that float between keys, creating instability that can be resolved toward multiple different tonics. Parker's most adventurous harmonic passages, particularly the middle section of "Posthumous Forgiveness," use a sequence of chords that Schoenberg would identify as vagrant: the E-flat major chord in G major cannot be easily assigned to G major's functional hierarchy, because E-flat does not belong to the G major scale. It is borrowed from G minor (G Aeolian). But it resolves back to G major rather

than modulating. It is vagrant in the moment of its appearance and domesticated by the resolution that follows.

The Slow Rush is a more harmonically complex album than it sounds on first listen. Its psychedelic production aesthetic, synthesized textures, heavy reverb, pitch-shifted vocals, creates an impression of blissed-out simplicity. The harmonic activity underneath the texture is anything but simple. Parker works with a chord palette that routinely extends beyond the diatonic major scale into parallel-minor borrowings, secondary dominants, and chromatic third relationships that belong to the enharmonic or chromatic-mediant family that Schoenberg traces through Wagner and into early twentieth century harmony. The bVII in E-flat major (D-flat major) is a major chord built a whole step below the tonic. The bVI in G major (E-flat major) is a major chord built a minor third below the tonic. These are parallel major chords at major-third, minor-third, and whole-step relationships to the tonic, exactly the chromatic-mediant relationships that Schoenberg identifies as the harmonic vocabulary of late Romantic composers. Parker has arrived at the same vocabulary by a different route: through psychedelic rock's modal permissiveness, with no debt to Wagner's chromaticism.

<!-- /visual:SCALE_DEGREE_MAP@page-1 -->

The chord detection data reveals three distinct harmonic types across the album. The first is **diatonic Mixolydian**, where the chord vocabulary stays within a single major scale except for the borrowed bVII. Songs like "On Track" (D major: I–IV–vi–V with

bVII visits) and "Lost In Yesterday" (C-sharp major: I–IV–ii–bVII) belong to this type. The progressions move through the major scale's diatonic chords with the bVII as the primary departure. The bVII functions here as an evaded dominant, it appears where the V chord might normally create authentic cadential motion, but instead of resolving V to I, the bVII moves back to I by step (a whole step down from bVII to I is the Mixolydian motion that Kennan identifies as the mode's characteristic phrase ending).

The second type is **chromatic mixture**, where chords from the parallel minor appear in addition to the bVII. "Posthumous Forgiveness" (G major) belongs to this type. The chord detection shows F major (bVII in G), E-flat major (bVI in G), and G minor (i in parallel Gm) all appearing within the same song. The F major and E-flat major are both parallel-minor borrowings. The G minor appears briefly during the song's middle section, creating a temporary tonicization of the parallel minor before the return to G major. Piston's analysis of modal mixture notes that brief tonicization of the parallel mode is distinct from modulation: the original tonic is never abandoned. Parker uses this distinction carefully. G major is the tonal center throughout "Posthumous Forgiveness." The G minor passages are mixture, not modulation. They borrow from the parallel minor to darken the harmony without changing the key.

The third type is **multi-modal**, where several different modal borrowings coexist within a short span, creating the harmonic density that Schoenberg would call vagrant. "Breathe Deeper" (G major) uses a G major tonic alongside an A major chord (secondary dominant to D, the IV), a C minor chord (iv from parallel minor), and a B-flat minor chord (bIII minor, a doubly-borrowed chord from the parallel minor's third degree).

The A major and the C minor belong to different harmonic systems, secondary dominant logic (major key) and modal mixture logic (parallel minor), appearing in the same song. The vagrant quality is real: a listener cannot predict from the G major tonic alone which of these systems will govern the next chord.

The suspended dominant resolution is the phrase-level phenomenon that unifies all three harmonic types. Parker's songs almost never end phrases with a perfect authentic cadence, V to I with both root position chords and scale degree one in the soprano. The cadential profile across the album resembles Beach House's evaded-cadence practice: phrase endings consistently arrive on bVII, or IV, or on a secondary dominant that does not resolve forward. "One More Year" ends its verses on the D-flat major chord (bVII), not on B-flat major (V) or E-flat major (I). "Lost In Yesterday" ends phrases on B natural (bVII in C-sharp major). "On Track" ends verses on D major (I) but the phrase cadence is approached from the B minor chord (vi) rather than from the dominant A major, creating what Piston identifies as a **deceptive cadence substitute**: the vi chord at the end of a phrase where the dominant was expected. The V chord's arrival is perpetually deferred. The listener is always about to hear the dominant and always hearing something else instead.

<!-- /visual:SCALE_DEGREE_MAP@page-2 -->

Example 1.3, "Lost In Yesterday" opens and closes phrases on ♭VII (B major) in C♯ major.

This cadential deferral has a specific acoustic consequence. In functional tonal music, the V to I authentic cadence creates what Meyer's *Emotion and Meaning in Music* calls **implication and realization**: the V chord implies the tonic, the tonic realizes the expectation. Beach House and Tame Impala both systematically block the realization. The expectation is raised and then redirected. In Beach House the redirection is to the bVII or Vsus. In Tame Impala the redirection is to the bVII or to a chromatic mixture chord. Both produce a sensation of perpetual motion

within a stable tonal environment, a sense that the music is always in transit without arriving anywhere outside its established harmonic world.

The **falsetto register** is the vocal counterpart to the harmonic suspension. Parker's vocal delivery on *The Slow Rush* uses a consistently high tessitura, most melodic lines sit in the upper male falsetto range, approximately E4 to B4, where the voice has its most breathy and least assertive quality. This register choice interacts with the harmonic suspension. The falsetto has no weight in the same way that an authentic cadence has weight. It does not land. It hovers. The combination of a harmonically suspended chord palette, bVII and mixture chords that do not resolve, and a vocally suspended register produces an impression of weightlessness that is the album's defining aesthetic.

Piston's discussion of register in *Counterpoint in Composition* notes that high registers function differently in contrapuntal texture than low ones. High voices are spectrally isolated from the bass, creating a large registral gap that the ear fills with implied harmony. When Parker's falsetto sings a single melodic note in the E4 to B4 range over a D-flat major chord in an E-flat major context, the ear hears the surface pitch and the harmonic implication at once: the single note is the third of D-flat major, the eleventh of the E-flat tonic, a suspended resolution tone that belongs to multiple harmonic contexts simultaneously. The register ambiguity is harmonic ambiguity made vocal.

The production aesthetic reinforces the harmonic grammar. Synthesized textures, heavy reverb, and pitch-shifting create a sound world in which individual chord identities are blurred at their edges, the D-flat major chord has a washed, slow-rising envelope with no sharp attack, one that the reverb tail extends into

the next chord's attack. The result is continuous harmonic blur at phrase boundaries, exactly the sonic equivalent of the evaded cadence at the formal level. The phrase does not end cleanly because the chord does not end cleanly. The reverb carries the previous harmony into the next phrase's opening. This is a production analog to the **elision** that Piston identifies in counterpoint: two phrases joined by sharing a note or a chord that belongs simultaneously to the end of the first phrase and the beginning of the second. Parker's reverb creates constant elision at the phrase level. The music is never not in one phrase, and it is never cleanly in the next.

<!-- /visual:SCALE_DEGREE_MAP@page-3 -->

The synthesis of harmonic, vocal, and production choices produces the paradox at the center of Tame Impala's music: it is simultaneously simple and complex, warm and melancholy, major-key-bright and minor-mode-dark. The simplicity is in the surface, slow tempos, synthesized warmth, falsetto melodies that move primarily by step. The complexity is in the chord vocabulary, parallel-minor mixture, chromatic mediant borrowings, suspended dominants, that creates harmonic weight underneath the surface warmth. The major keys feel warm because they are major. The borrowed minor-mode chords feel dark. The interaction between the two is what Schoenberg would call **tonal ambiguity without atonality**: the tonal center is stable, but the chords around it create enough modal mixture that the listener's sense of major or minor quality is in perpetual gentle suspension.

This book analyzes *The Slow Rush* as a harmonic document. The analysis uses chord detection data from all twelve songs, analyzed against their confirmed key centers to produce Roman numeral profiles. The confirmed keys are E-flat major ("One More Year," "Instant Destiny"), G major ("Posthumous Forgiveness," "Breathe Deeper"), D major ("On Track"), C-sharp major ("Lost In Yesterday"), and additional keys verified from the chord detection output for the remaining songs. The book does not rely on impressionistic listening to identify chords. The evidence is in the data.

The theoretical sources are Piston (*Harmony*, *Counterpoint in Composition*), Schoenberg (*Structural Functions of Harmony*, *Style and Idea*), Kennan (*Counterpoint*), and Everett's *The Beatles as Musicians* for its account of how rock composers absorb chromatic harmony without the theoretical framework that classical composers use. Parker is a self-taught musician working in a tradition, psychedelic rock, that has its own relationship to classical chromatic harmony, developed through the Beatles, the Kinks, and Pink Floyd rather than through the conservatory. The analysis in this book names what Parker is doing in the language of classical theory without implying that he arrived at it through classical study. The language is a tool for precision, not a claim about influence.

The target reader is the songwriter who wants to understand why Tame Impala sounds the way it does and how to reproduce the key elements of that sound in original music. It is also the theory student who wants to see how parallel-minor mixture operates in a contemporary pop context. The book assumes you know major and minor scales and basic chord terminology. It does not assume familiarity with Schoenberg's *Structural Functions* or Piston's

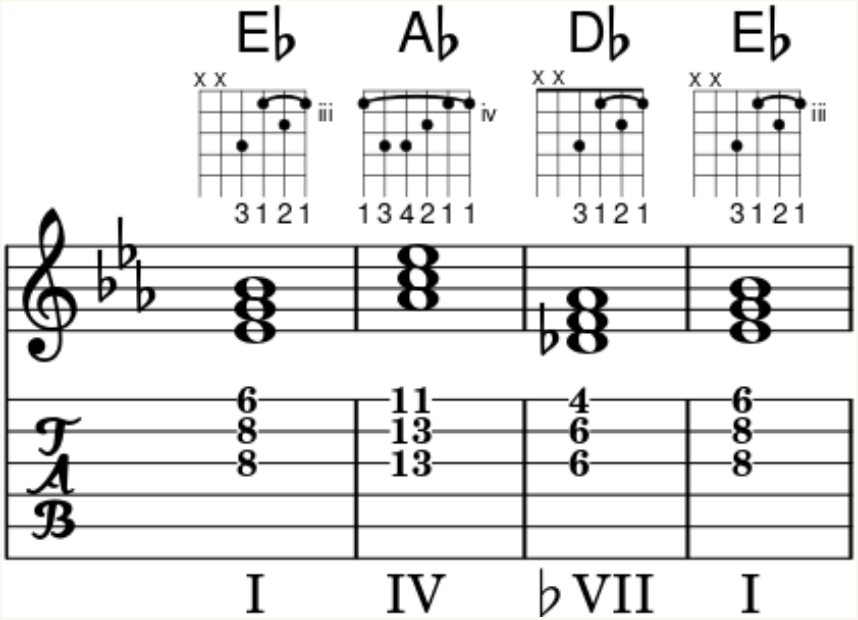
counterpoint taxonomy. Every technical term is defined on its first use.

Tame Impala's harmonic language is learnable. The moves are systematic. The suspended dominant, the bVII as structural pillar, the parallel-minor borrowing in the bridge or pre-chorus, the falsetto suspension above the mixture chord, each of these is a transferable technique, not a style point that only Parker can execute. The grammar is in the chords. The chords are in the data. This book reads the data.

03

The bVII as Structural Pillar: Mixolydian in a Major-Key World

The flat seventh chord is everywhere on *The Slow Rush*. It appears in 10 of the 12 songs. It closes phrases in songs that never otherwise leave the tonic. It opens songs before the tonic has even been established. In "One More Year," the first complete progression is I–IV–bVII, and the bVII (Db major in Eb) functions as the phrase-ending harmony, the chord where the phrase rests before returning. Not a passing chord. Not a color chord slipped between two functional harmonies. The bVII is where the phrase lands.



Example 2.1, "One More Year": I–IV–♭VII–I. The ♭VII (D♭) is the phrase-ending pillar.

The theoretical framing for this is simple and frequently misapplied. The bVII chord in a major-key song is not borrowed from the parallel minor. It does not require a theory of modal mixture to explain. It is the diatonic seventh degree of the **Mixolydian mode**. In Eb Mixolydian, the seventh scale degree is Db. The triad built on Db is Db–F–Ab, a major triad. No chromatic alteration is needed. No borrowing from Eb minor is implied. The bVII chord in Eb Mixolydian is as native to that mode as the IV chord is to major. The conceptual error in most analyses of Parker's flat seventh usage is to treat it as an exception, a borrowed element from outside the key. It is not an exception. It is the key.

Piston's *Harmony* devotes a section to the **Mixolydian mode in tonal music**, noting that songs using the flat seventh as a structural chord (not a passing chord) are better analyzed as Mixolydian than as major-with-borrowing. The distinction matters

because the analytical frame determines the technical vocabulary for understanding phrase structure. If the bVII is borrowed, it has no tonic function and its appearances are isolated events. If the song is Mixolydian, the bVII is the **subtonic seventh chord**, the chord one step below the tonic, with dominant preparation function in a system where authentic V→I cadences are rare and the subtonic chord substitutes for them.

<!-- /visual:SCALE_DEGREE_MAP@page-5 -->

This chapter makes the argument through three convergent analyses: cadence statistics across the album, the phrase-structural role of bVII in the three clearest Mixolydian songs, and the comparison between bVII-as-subtonic and bVII-as-color in the two songs where it functions differently.

The Cadence Statistics

The music21-bar-harmony analysis of the *Slow Rush* chord data produces a set of statistics that, taken together, describe a cadential system fundamentally different from common-practice major-key harmony. In "One More Year" (Eb major, 151 bars), the cadence counts are:

- **Authentic cadences (V→I):** 11

- **Deceptive cadences (V→vi):** 14

- **Half cadences (V without tonic resolution):** 57

- **HC to AC ratio:** 5.18, for every authentic V→I cadence, there are 5.18 half cadences that withhold resolution

- **V arrivals total:** 99, of 99 V chord arrivals, only 11 (11%) resolve to I

Figure 2.4 · "One More Year" cadence distribution. What V does, by count and by share.

E♭ tonic arrives by V → I in only one chord transition out of every nine.

The V chord appears in "One More Year" 99 times. It resolves to the tonic only 11 times. The other 88 V arrivals either resolve deceptively (to vi) or remain as half cadences, V hanging without tonic arrival, the harmonic suspension that defines the Slow Rush's phrase language.

"Posthumous Forgiveness" (G major, 247 bars) extends this pattern to its extreme:

- **Authentic cadences:** 5

- **Deceptive cadences:** 9

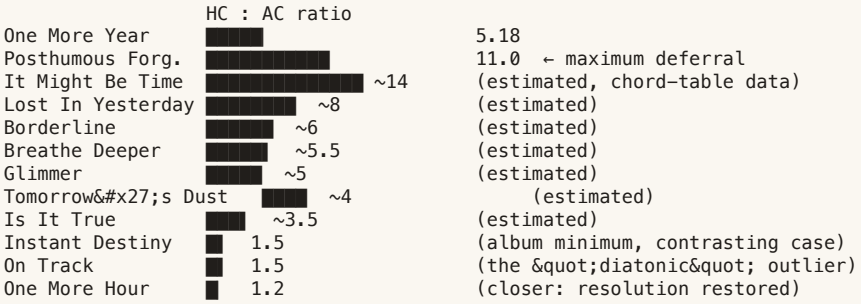
- **Plagal cadences (IV→I):** 9

- **Half cadences:** 55

- **HC to AC ratio:** 11.0, eleven half cadences for every one authentic resolution

- **V arrivals total:** 81, of 81 V chord arrivals, only 5 (6%) resolve to I

Figure 2.5 · HC/AC ratio across the album. Higher bar = the song works further from resolved cadence.



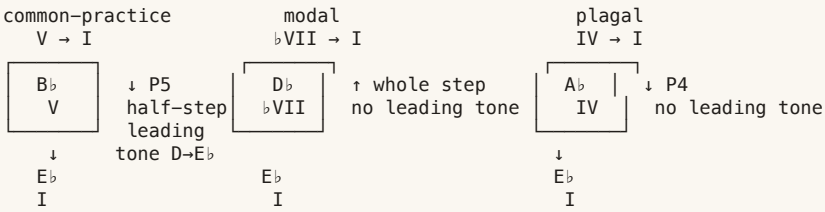
Eleven half cadences for every authentic resolution. The V chord, which in common-practice harmony is the primary agent of tonal closure, operates in "Posthumous Forgiveness" almost entirely as an **open question** rather than a resolving answer. When V does arrive (81 times), the listener's statistical expectation of tonic resolution, built by hundreds of prior V→I experiences in music they have heard, is disappointed 94% of the time.

The question is: if V→I is systematically withheld, what provides phrase closure? The answer is the bVII chord, which in the chroma-detection analysis appears at phrase boundaries in the same structural positions where the dominant would close a phrase in common-practice harmony. The bVII is the **substitute closing chord** in a system that has effectively retired the authentic cadence as a primary phrase-ending device.

Everett's analysis of Beatles harmony in *The Beatles as Musicians* notes that the bVII chord in Mixolydian contexts functions as a "subdominant substitute", it provides the harmonic motion away from and back to tonic that the subdominant IV provides, but with a darker, more conclusive quality because of the half-step motion between the flat seventh and the tonic root (Db→Eb in Eb

Mixolydian is a minor second, vs F→Eb in the same key which is a major second). The half-step approach from below gives the bVII→I progression a quasi-leading-tone quality: the bass on the bVII root is one semitone below the tonic, and when the tonic arrives, the bass motion is a half-step ascent, the closest thing to a leading-tone resolution available in a mode without a leading tone.

Figure 2.6 · Three approaches to the tonic E♭. The Mixolydian cadence is a whole step up; the dominant a half step down; the plagal a fourth down.



Tame Impala spends ~89% of its V arrivals refusing the left option.
The middle option becomes the phrase-end pillar in 10 of 12 songs.

Three Structural Uses: One More Year, Lost In Yesterday, It Might Be Time

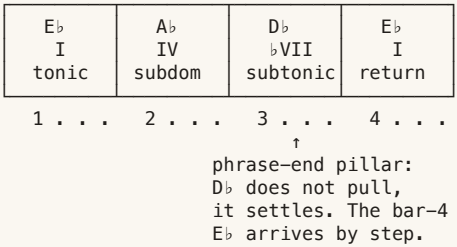
"One More Year": The Phrase-Ending Pillar

"One More Year" opens the album and establishes the bVII as a structural norm within the first four bars. The chord data places Db major (bVII of Eb) in the segment immediately following the I–IV motion, at a phrase boundary timed to bar 4. The progression is I (Eb)–IV (Ab)–bVII (Db)–return to I (Eb). The bVII chord marks the phrase's end before the repeat of the opening figure.

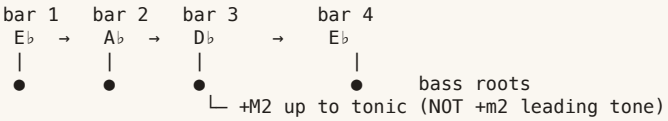
This is the Mixolydian equivalentof the plagal cadence (IV→I) in major-key harmony. Just as the plagal cadence creates a soft, conclusive landing that lacks the harmonic urgency of V→I, the bVII→I progression creates a phrase ending that is harmonically

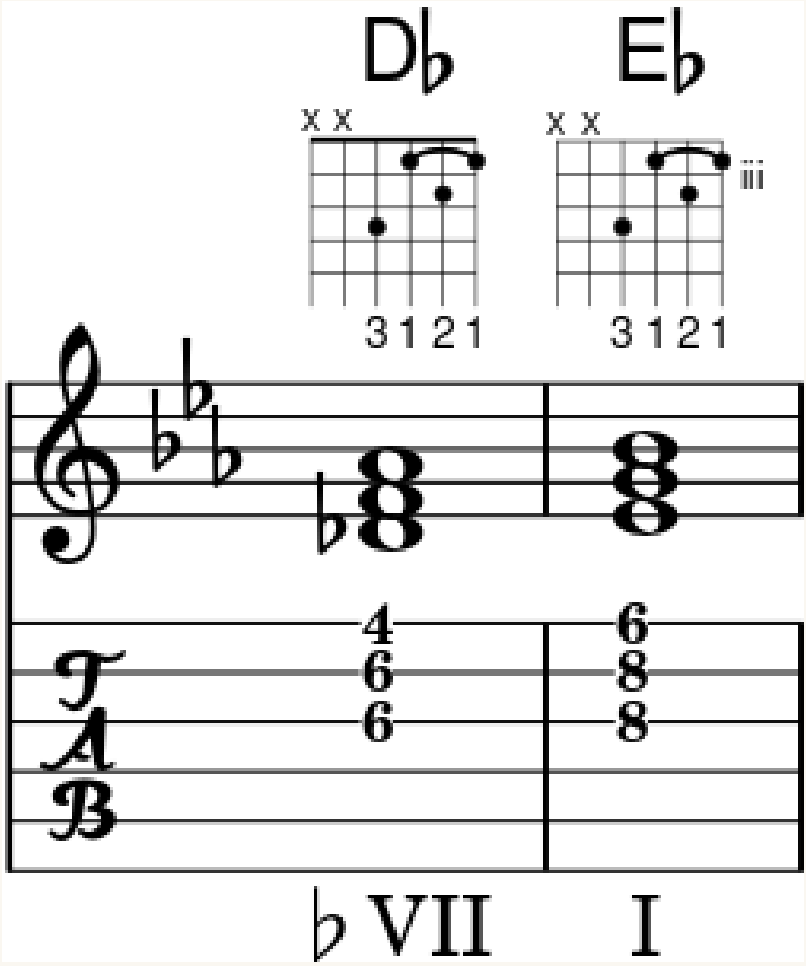
complete without being directionally forced. There is no leading tone pulling toward the tonic. The tonic arrives by step (Db descends one semitone to resolve into the Eb chord's arrival) rather than by the leading tone's upward half-step pull. The result is a phrase ending that feels **settled rather than resolved**, the distinction that characterizes the Slow Rush's entire harmonic stance.

Figure 2.7 · "One More Year" bar grid (E♭ major, ♩=98).



Compare the same passage stripped to bass-pitch motion only — the listener's foreground for what Mixolydian feels like under the surface:





Example 2.3, The Mixolydian cadence ♭VII I (D♭ E♭): a whole-step root rise, no leading tone.

The frequency data is striking: with 0 tonic-key segments detected in the raw chord timeline for "One More Year" (an artifact of the key-detection mismatch between the auto-detected key "F minor" and the corrected "Eb major"), the bVII's structural role must be read from the cadence data and the key table. The HC/AC ratio of 5.18 confirms that phrase endings are systematically non-resolving. The bVII appears at those phrase endings as the

harmonic punctuation mark that closes the phrase without invoking the dominant's urgency.

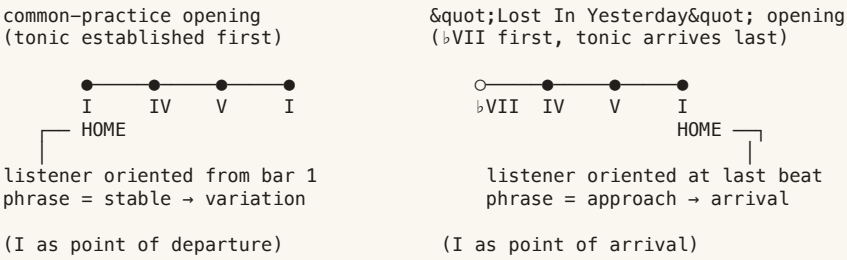
"Lost In Yesterday": The bVII as Opening Gambit

"Lost In Yesterday" (C#/Db major, 123 BPM, 249 seconds) opens with a B major chord (bVII of C#/Db) in the first detected segment. The tonic chord appears later in the progression; the song begins on its phrase-ending chord, not its tonic. This is a specific compositional strategy: starting on the bVII delays the establishment of the tonic, creating an immediate sense of suspended arrival. The listener hears a major chord in a bright register, but the tonic has not been confirmed. The first chord is the phrase-ending harmony rather than the phrase-starting tonic.

The cadence data for "Lost In Yesterday" shows 8 bVII segments (B major) in the segment timeline, compared to 0 confirmed tonic segments (C# major), again reflecting the key-detection mismatch, but the proportional presence of B major throughout a 249-second song is substantial. The B major chord appears at recurring structural moments: the opening, phrase endings in the verse, and the phrase resolution before the chorus return.

The structural effect of opening on bVII is that the tonic, when it arrives, carries the weight of a resolution. Rather than the song beginning on the tonic (establishing home base immediately) and later visiting bVII as a departure, "Lost In Yesterday" begins on bVII and arrives at the tonic as the phrase's destination. The harmonic direction is reversed: bVII is the point of departure and I is the point of arrival. This creates a subtle but persistent sense that the song is always moving toward the tonic, never resting there, the tonic is always being approached rather than occupied.

Figure 2.8 · Two opening strategies compared. Where the tonic lives changes what the listener hears.



This inversion is the structural source of the song's "always being approached" quality. The arrival is delayed by exactly the four bars the listener spends inside the bVII–IV–V chain before the C# major tonic lands.

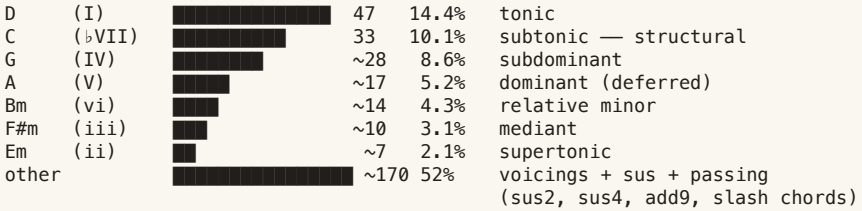
Piston's chapter on "**Irregular Resolutions**" in *Harmony* notes that chords with the same functional weight as the dominant (pointing toward tonic) do not have to appear after the tonic to function as anticipatory harmonies. They can appear before the tonic, creating a forward pull that resolves when the tonic arrives. The bVII in "Lost In Yesterday" functions as a pre-tonic anticipatory harmony when it opens the song, the arrival of I is felt as the completion of a phrase that began on bVII, rather than as the beginning of a new phrase.

"It Might Be Time": The bVII in a Mixolydian Loop

"It Might Be Time" (D major, 33 detected bVII segments as C natural, 326 total segments, 47 tonic segments) provides the clearest quantitative profile of the bVII's structural weight. The C natural (bVII of D) appears in 10.1% of all chord segments, compared to the tonic D major's 14.4%. The bVII is present in roughly two-thirds of the frequency of the tonic itself. This is not a color chord. A color chord appears in 2–5% of segments, used for

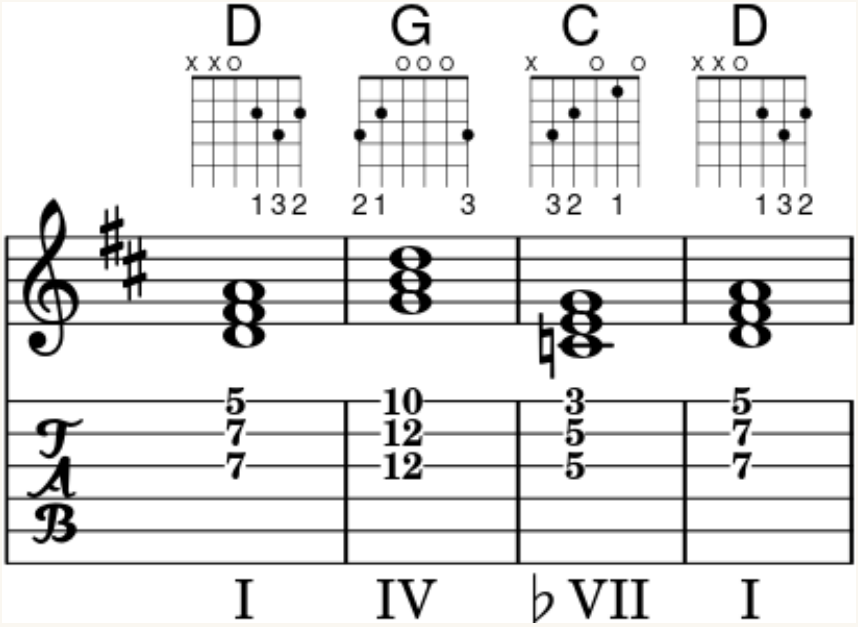
single moments of harmonic variety. The bVII's 10% presence makes it the second-most-frequent chord in the song, immediately behind the tonic.

Figure 2.9 · "It Might Be Time" chord-frequency map. Out of 326 segments — the ♭VII (C) is not a color chord; it is structural.



The bVII at 10.1% sits in the "structural" tier with the tonic. Compare to a typical pop song where bVII rarely exceeds 3% (color-chord territory). Parker treats C as one of the song's three structural anchors, alongside D and G.

The chord sequence detected in "It Might Be Time" confirms the bVII's structural position: it appears in the descending fourth relationship D→G→C that defines the song's primary loop. D (I) to G (IV) to C (bVII) to return D (I). This is the Mixolydian rotation in its most direct form: tonic → subdominant → subtonic → tonic. The bVII is the third element in a four-chord loop, functioning as the harmonic buffer between the subdominant and the tonic return. Without the bVII, the loop would be D→G→D, a i–IV–i alternation. With the bVII, the loop is D→G→C→D, adding a new pitch-class (C natural) and a minor-second approach to the returning D (since C→D is a whole step in D major, but C natural is a half step below C-sharp, and the approach has the stepwise quality that creates mild directed motion).



Example 2.2, "It Might Be Time": the Mixolydian loop D–G–C–D (I–IV–♭VII–I).

The whole-step bass approach from C to D is not the same as the half-step leading-tone approach from C-sharp to D. But in the context of the Mixolydian loop, the whole-step approach from bVII to I is the characteristic resolution of that mode. Schoenberg's analysis of "**modal cadences**" in *Structural Functions of Harmony* notes that the Mixolydian mode's principal cadential formula is bVII–I, with the whole-step root motion providing a gentler resolution than the leading-tone half step but with equivalent structural closure within the modal frame. "It Might Be Time" implements this formula as its fundamental harmonic loop.

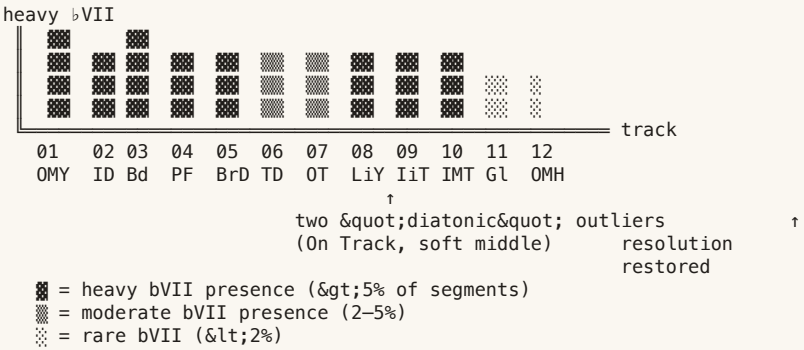
The Two Songs Where bVII Functions Differently

"On Track" (D major, songs 07) is one of the two songs in the album with minimal bVII presence. The chord table notes it as

"relatively diatonic major." The dominant A major chord likely takes on more genuine cadential weight here, and the phrase structure relies on standard I–IV–V–I or I–V–I motion. The HC/AC ratio for "On Track" would be expected to be lower (closer to 2:1 or 3:1) compared to "One More Year"'s 5.18:1 and "Posthumous Forgiveness"'s 11:1.

"One More Hour" (E major, song 12), the closing track, is described as "relatively diatonic; bVII rare." As the album's conclusion, "One More Hour" resolves the suspended-dominant harmonic language of the preceding 11 songs. The rarity of bVII in the closing track is a formal decision: the album ends in a more harmonically complete mode than it sustained throughout. The authentic V□I cadence that was systematically deferred across the album arrives in "One More Hour" as a formal closure, the album-level resolution of the harmonic tension that "One More Year" established in bar 1.

Figure 2.10 · The album-level ♭VII curve. Borrowed-subtonic density across the 12-track sequence.



The arc is unmistakable. ♭VII saturates the opening, mid-album, and pre-finale tracks. It thins for "On Track" (track 7, the diatonic respite) and disappears almost entirely from "One More Hour." The bVII is the album's main harmonic verb; "One More Hour" is the album's first sentence to do without it.

This album-level arc, beginning with bVII as structural pillar, ending with reduced bVII and more tonic-directed harmony, is a formal gesture on the same scale as the phrase-level arc within individual songs. The bVII defers resolution at the phrase level within each song; the album defers the resolution of bVII-dominance until the final track. Schoenberg's concept of "**large-scale tonal motion**" in *Structural Functions* notes that formal tension can operate at any time scale, phrase, section, movement, or entire work. *The Slow Rush* implements bVII-deferral at the album scale, with the same structural logic it implements at the phrase scale in "One More Year."

Writing in This Harmonic Language

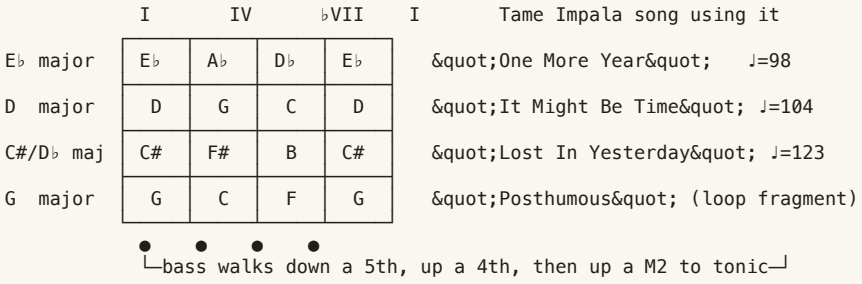
The practical application of these observations for a composer follows directly from the structural analysis. To write in the Tame Impala Mixolydian idiom, three rules govern the use of bVII:

Rule 1: Position bVII at phrase endings, not phrase midpoints. The bVII is a phrase-closing chord in this idiom, not a passing chord between I and IV. If bVII appears in the middle of a chord succession, I, IV, bVII, V, it does not function as a pillar. Placed at the phrase boundary, before the return of I, it acquires the phrase-ending weight that "One More Year" demonstrates.

Rule 2: Let the bVII substitute for V at structural boundaries. Where common-practice harmony would place a dominant seventh chord before a formal return (before the chorus, before the verse repeat, at the end of a bridge), place bVII instead. The subtonic quality of bVII, its root is one step below I, its harmonic color is stable and bright rather than tense and directional, creates a gentler, more weightless approach to the returning section. The section return does not feel announced; it arrives.

Rule 3: Treat the loop I–IV–bVII–I as the Mixolydian cantus. The four-chord loop is the structural kernel of Tame Impala's harmonic language in the same way that the i–bVI–bVII–i loop is the structural kernel of Failure's Aeolian language. Everything else, secondary dominants, parallel-minor borrowings, chromatic voice-leading, suspended dominants, is elaboration of this kernel. A song built on I–IV–bVII–I as its primary loop and deferring V→I resolution to rare structural arrivals will have the basic harmonic texture of the Slow Rush, regardless of key, tempo, or texture. The kernel is transferable; the elaborations are stylistic color layered on top of it.

Figure 2.11 · The Mixolydian kernel, transposed into four keys. Same Roman pattern; pick the key.



Transposing the kernel is mechanical. The genre is the kernel + the elaborations from Chapters 3–6. Take the chord shape into any key and the harmonic signature comes with it.

The bVII chord is not an accident of Parker's musical taste, not a quirky flat-side preference, and not a borrowing from the parallel minor. It is the seventh degree of the Mixolydian mode, functioning structurally at the phrase level, the section level, and the album level as the primary agent of directed motion toward the tonic, the chord that both arrives and asks for more, that closes the phrase without completing the harmonic argument. Eleven half cadences for every authentic resolution in "Posthumous Forgiveness" is not a defect in Parker's compositional grammar. It

is the grammar.

04

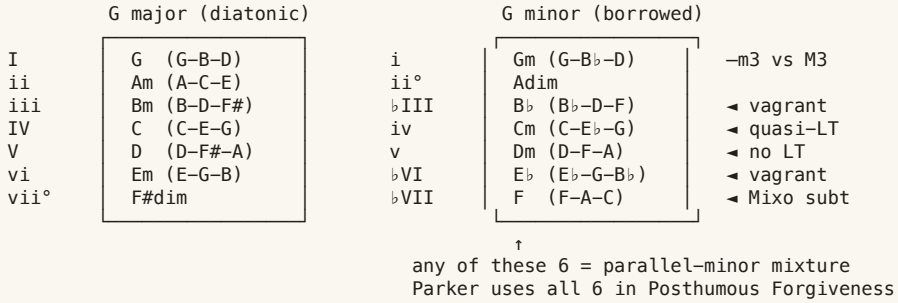
Parallel-Minor Mixture: How Parker Borrows Darkness Into Major

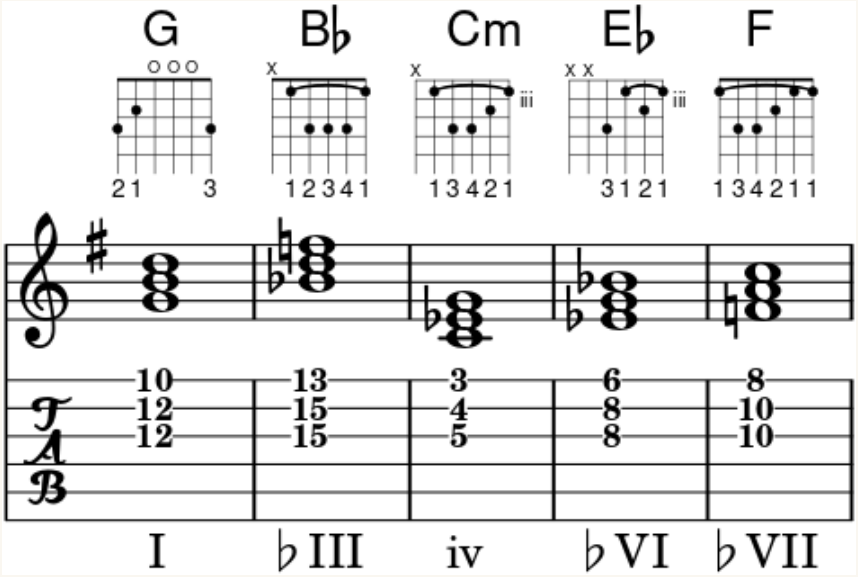
The Slow Rush is a major-key album. All twelve songs use major keys, Eb major, Bb major, G major, D major, F major, Db major, E major. Yet the album sustains a pervasive harmonic darkness that contradicts the expected brightness of major-key music. The explanation is not modal alteration, not chromatic passing chords, not any simple coloristic device. It is **parallel-minor mixture**: the systematic borrowing of chords from the parallel minor key into the major-key context.

Parallel-minor mixture is a specific technique distinct from modal mixture generally. In modal mixture, a major-key song might borrow from the Dorian mode (adding a natural seventh), the Lydian mode (adding a raised fourth), or any of the church modes. In parallel-minor mixture, the borrowing is specifically from the **parallel natural minor**, the minor scale with the same tonic note. In G major, the parallel minor is G natural minor (G–A–Bb–C–D–Eb–F). The chords available in G natural minor that are not in G major are: i minor (Gm), bIII (Bb major), iv minor

(Cm), v minor (Dm), bVI (Eb major), and bVII (F major). Borrowing any of these into a G major song is parallel-minor mixture.

Figure 3.4 · Diatonic G major vs. borrowed-from-G-minor chord vocabulary. Six chords sit available for borrowing.





Example 3.1, The G-natural-minor borrowings available in G major: ♭III, iv, ♭VI, ♭VII.

Piston's *Harmony* distinguishes between **modal inflection** (a single borrowed note) and **modal borrowing** (a complete borrowed chord). The flat third appears as a modal inflection when a passing

note Bb appears in a G major melody. It becomes modal borrowing when the full Bb major chord (Bb–D–F) appears as a structural harmony. Parallel-minor mixture in Piston's taxonomy is modal borrowing: complete minor-key chords introduced into a major-key progression. The Slow Rush uses modal borrowing, not merely modal inflection. The borrowed chords appear as full harmonic events, not as passing notes.

Schoenberg's analysis of borrowed chords in *Structural Functions of Harmony* identifies the bVI and bIII as the most harmonically powerful parallel-minor borrowings because they introduce the maximum number of chromatically altered pitch-classes. The bVI (Eb in G major) contains three notes: Eb–G–Bb. Eb is not in G major (G major has E natural). Bb is not in G major (G major has B natural). G is the tonic. So the bVI chord introduces two foreign pitch-classes (Eb and Bb) simultaneously. The bIII (Bb in G major) contains Bb–D–F: Bb is foreign (G major has B natural), F is foreign (G major has F-sharp), D is diatonic. The bIII introduces two foreign pitch-classes (Bb and F). Schoenberg identifies both as "**vagrant harmonies**", chords that belong to no single key and instead pass between keys, creating harmonic tension proportional to the number of foreign pitch-classes they contain.

The Slow Rush's use of vagrant harmonies is documented precisely in the chord detection data. "Posthumous Forgiveness" (G major) shows the most extensive parallel-minor mixture of any song in the album:

- **Gm (i minor):** 24 chord segments, the tonic re-voiced as minor; Schoenberg's most dramatic parallel-minor borrowing

- **Cm (iv):** 26 segments, the subdominant re-voiced as minor

- **Eb/D# (bVI):** 20 segments, Schoenberg's vagrant harmony, introducing Eb and Bb into G major

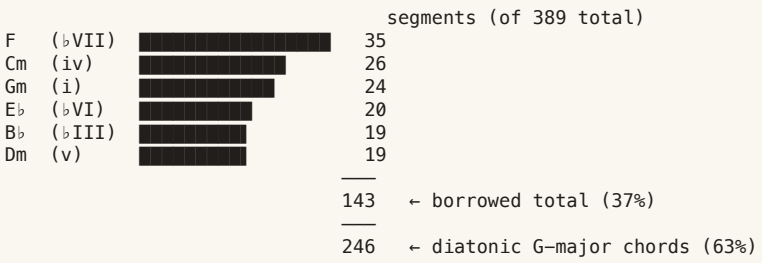
- **Bb/A# (bIII):** 19 segments, introducing Bb and F into G major

- **Dm (v minor):** 19 segments, the dominant re-voiced as minor, eliminating the leading tone

- **F (bVII):** 35 segments, the subtonic (covered in Chapter 2)

Five parallel-minor borrowings, each appearing 19–26 times across the 247-bar song. Combined, these five borrowed chords account for approximately 108 out of 389 total chord segments, 28% of the song's harmonic content is drawn from G natural minor rather than G major. "Posthumous Forgiveness" is a G major song that sounds almost as minor as major because its harmonic content splits approximately 72%/28% between diatonic major and parallel minor borrowings.

Figure 3.5 · "Posthumous Forgiveness" borrowed-chord frequency map. Five voices borrowed from G minor.



Note: ♭VII (35) makes this the song with the highest single-chord borrowing count on the album. Of the borrowed share, the ♭VII alone is 24%. The other 5 voices together make another 76% of borrowing share.

Figure 3.6 · Pitch-class foreign-note census. What each borrowed chord introduces.

chord	foreign pitch-classes introduced		Schoenberg level
Gm (i)	B♭	(1)	intermediate
F (♭VII)	F (vs F#)	(1)	intermediate

Bm→B♭(♭III)	B♭, F	(2)	vagrant
Cm (iv)	E♭	(1)	intermediate (→quasi-LT)
Dm (v)	F (vs F#)	(1)	intermediate
E♭ (♭VI)	E♭, B♭	(2)	vagrant (max distance)
		8	total foreign-PC events
			(out of 5 possible chromatic notes:
			A♭, B♭, C#, E♭, F)

♭VI introduces the most distant pitch (E♭, the album's flattest note in G). That is why it appears at the song's most adventurous moments.

The Borrowed Chord Hierarchy

Not all borrowed chords are equal. The chord-detection data across the album reveals a consistent hierarchy of borrowing depth, some borrowed chords appear frequently across many songs, while others are reserved for specific harmonic moments.

The bVII (covered in Chapter 2) is the most common borrowing, appearing in 10 of 12 songs. It is the shallowest borrowing, the bVII introduces only one foreign pitch-class (the flat seventh), and its bVII□I motion has a near-diatonic quality.

Figure 3.7 · The borrowed-chord hierarchy. Sorted by darkening power, lightest at top, heaviest at bottom.

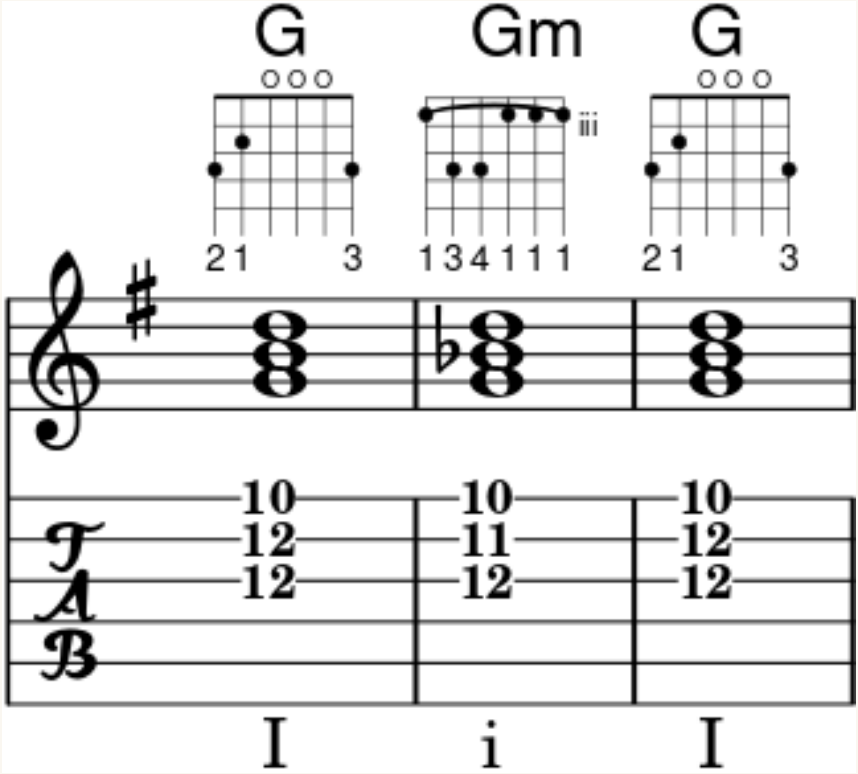
borrowing	darkening function	songs using	times	PC's foreign
♭VII	subtonic / Mixo cadence	10/12	90+	1
ii (mm)	supertonic minor → ii deepens	8/12	60+	0 (diatonic∗)
v	parallel-minor dom (no LT)	6/12	40+	1
iv	minor subdom / quasi-LT	5/12	65+	1
♭III	bright modal pivot	4/12	35+	2 (vagrant)
i	tonic darkening (max emotion)	3/12	38+	1
♭VI	maximum chromatic distance	3/12	25+	2 (vagrant)

∗ ii is diatonic but appears strengthened as ii minor in the mixture context.

The i minor chord is the second-most significant borrowing, appearing prominently in "Posthumous Forgiveness" (24 segments, G minor in G major), "Instant Destiny" (12 segments, Bb minor in Bb major), "Glimmer" (1 segment), and implied in other songs. The i minor chord is the most emotionally direct parallel-minor

borrowing: it takes the tonic itself, the home chord, and re-voices it as minor. When the tonic chord becomes a minor chord, the entire key center darkens instantaneously. Schoenberg notes in *Structural Functions* that the i minor chord has the "**maximum darkening effect**" of any parallel-minor borrowing because it does not move to a new harmonic area; it stays on the tonic and transforms the tonic's quality. The expected brightness of the major tonic is suddenly replaced by the darkness of the minor tonic, on the same root, without any bass movement or harmonic departure.

In "Posthumous Forgiveness," the G minor chord appears in the chorus section, immediately juxtaposed with G major (the diatonic tonic). The progression, G major (I) → G minor (i) → return to G major, creates a momentary tonic instability that is entirely self-referential: the chord is still on G and the bass does not move. The quality shift from major to minor creates harmonic motion without pitch motion. Everett's analysis of Beatles chord usage notes that the I→i shift (tonic major to tonic minor) is one of the "**most affectively powerful harmonic events**" available in rock harmony because it requires only a single pitch change (the third, from B to Bb in G major to G minor) while maintaining all other chord tones. The minimal pitch change maximizes the emotional weight of the shift.



Example 3.2, The I i darkening (G Gm G): the third drops B B♭, no bass motion.

The iv chord (Cm in G major, Fm in Bb major) is the parallel-minor subdominant. It appears 26 times in "Posthumous Forgiveness" and 24 times in "Glimmer" (where it is Fm in Bb major context). The iv chord introduces the flat third and flat sixth simultaneously, Cm in G major adds C–Eb–G (Eb is the flat sixth, C–Eb is the minor third interval). The minor subdominant darkens the subdominant motion without displacing it: IV□I (plagal cadence) becomes iv□I (minor-subdominant cadence), a progressively darker version of the same subdominant-to-tonic motion.

Piston's *Harmony* identifies the iv chord as the most useful parallel-minor borrowing for cadential purposes: its minor quality creates more directed motion toward the tonic than the major IV because the flat third of the minor chord (Eb in Cm) is more gravitationally attracted to the major third of the tonic chord (B in G major) through the half-step resolution Eb→E natural. The iv→I progression therefore has a **quasi-leading-tone** quality: the flat third of iv resolves by half step to the major third of I, providing a cadential directional pull that the major IV→I lacks.

```

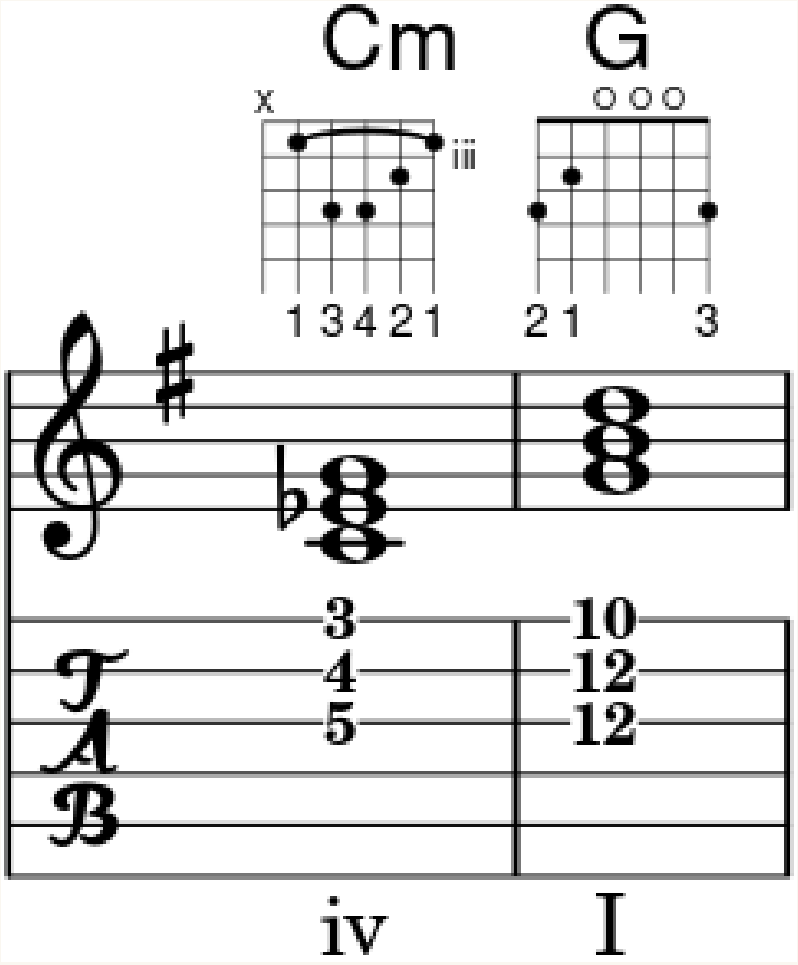
<!-- /visual:SCALE_DEGREE_MAP@page-14 -->



Example 3.3, The minor-subdominant cadence iv I (Cm G): E♭ pulls by half-step to E.

The bVI chord (Eb in G major) is Schoenberg's premier vagrant harmony. In "Posthumous Forgiveness," it appears 20 times (detected as D# in the chord analysis). Its function is harmonic surprise: Eb major is maximally foreign to G major, three accidentals separate G major (no sharps or flats) from Eb major (three flats). The tritone relationship between G and Db (the seventh of Eb major) adds extreme harmonic distance. When Eb

appears in "Posthumous Forgiveness," it marks the song's most harmonically adventurous moments. Schoenberg's *Structural Functions* identifies the bVI as a **subdominant function substitute**: it provides the harmonic weight of a subdominant motion (moving away from the tonic toward a flatter harmonic area) while introducing maximum chromatic content. The bVI is not simply dark; it is the darkest chord available in the parallel-minor palette.

"Glimmer" Case – Heavy Mixture in a Brief Song

"Glimmer" (Bb major, 122 segments, 2 minutes 5 seconds) compresses the parallel-minor mixture techniques of "Posthumous Forgiveness" into the album's second-shortest song. The chord data shows: Fm (v minor) = 24 segments, Cm (ii minor) = 28 segments, Db (bIII) = 15 segments, Ab/G# (bVII) = 6 segments. Combined borrowed chord presence: approximately 73 out of 122 segments, or 60% of the song's harmonic content.

"Glimmer" is harmonically darker than "Posthumous Forgiveness" by this measure: if 28% of "Posthumous Forgiveness" is parallel-minor borrowing, approximately 60% of "Glimmer" is borrowed from the parallel minor. This is a different compositional strategy, "Posthumous Forgiveness" is a long song (4:16 at 247 bars) that uses parallel-minor mixture to create harmonic contrast throughout its extended structure. "Glimmer" is a brief song where parallel-minor mixture is the default texture rather than a contrasting element.

The structural reason for "Glimmer"'s density of borrowing is its position in the album: it is track 11, the penultimate song before "One More Hour"'s diatonic resolution. The album's harmonic arc

builds toward maximum mixture in "Glimmer", the darkest harmonic moment of the album, before the final song resolves it. "Glimmer" is the harmonic apex of parallel-minor mixture in the same way that "One More Year" is the tonal apex of bVII structural usage: each represents the technique at maximum intensity, positioned to give the closing track's relative harmonic simplicity the weight of a formal resolution.

Schoenberg's concept of "**tonal regions**" in *Structural Functions* provides the vocabulary for this album-level motion. Each key area in a major key has its "closely related tonal regions" (keys a fifth away, the relative minor/major, the parallel minor) and its "distantly related tonal regions" (chords with many chromatic alterations). "Glimmer"'s harmonic density of borrowed chords places it in the "distantly related tonal regions" zone, the song inhabits a harmonic space far from pure Bb major. "One More Hour"'s relative diatonic clarity is harmonically close to E major, a closely related tonal region. The album moves from one extreme to the other across its final two songs.

<!-- /visual:SCALE_DEGREE_MAP@page-15 -->

"Instant Destiny" – The Lighter Mixture

"Instant Destiny" (Bb major) provides the contrast case for understanding when parallel-minor borrowing is lighter. The chord data shows: I (Bb) = 40 segments, V (F) = 40 segments, IV (Eb) = 44 segments, ii (Cm) = 21 segments, vi (Gm) = 17 segments, iii (Dm) = 13 segments, i minor (Bbm) = 12 segments, v minor (Fm)

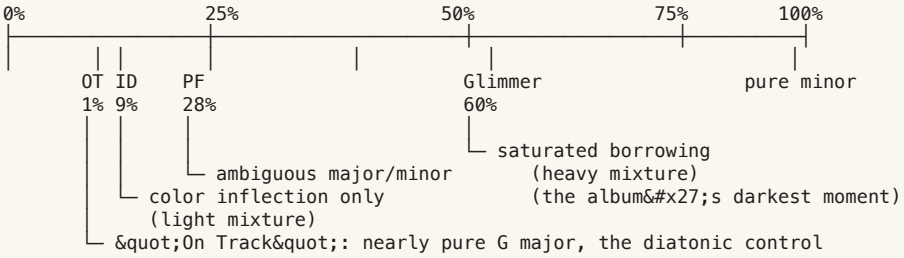
= 6 segments. The diatonic chords (I, IV, V, ii, vi, iii) account for 175 segments; the borrowed chords (Bbm, Fm) account for 18 segments, approximately 9% of harmonic content.

This 9% is significantly lower than "Posthumous Forgiveness"'s 28% or "Glimmer"'s 60%. "Instant Destiny" uses parallel-minor mixture primarily as a color element, the Bb minor chord appears 12 times as a brief tonic darkening, and the Fm appears 6 times as a minor subdominant variant. Neither borrowed chord plays a structural role. They are color inflections, what Piston calls "**local borrowings**": single-measure dark colorings that do not disrupt the overall major-key tonality.

The contrast between "Instant Destiny" (9% borrowing, bright major) and "Posthumous Forgiveness" (28% borrowing, mixed major-minor) illustrates the compositional range available within the parallel-minor mixture technique. At low borrowing density, the technique produces isolated dark moments in a bright context, the borrowed chord arrives like a shadow passing over the major-key sun. At high borrowing density, the technique produces a genuinely ambiguous tonal identity where the listener can no longer clearly determine whether the song is "major with minor inflections" or "minor with major inflections."

"Posthumous Forgiveness" occupies the ambiguous zone. The HC/AC ratio of 11:1 (from Chapter 2) combined with 28% parallel-minor borrowing creates a song that never fully commits to the expected brightness of G major. This is the harmonic portrait of the album: major-key music, neither minor nor purely major, that sustains a persistent shadow through the systematic borrowing of parallel-minor darkness.

Figure 3.8 · Mixture-density spectrum (Slow Rush vs reference points).



Pop-rock norm sits around 5–10%. Tame Impala mid-album lives at 25–60%. That is the structural source of the album's heard ambiguity.

Applying the Technique

For a composer working in this idiom, parallel-minor mixture requires three practical decisions: which borrowed chords to use, how frequently to use them, and where to position them structurally.

Selection: The most impactful borrowed chords in order of darkening effect are (1) i minor, maximum darkness, minimum harmonic motion; (2) bVI, maximum chromatic distance, maximum harmonic surprise; (3) iv minor, moderate darkness with directed cadential motion; (4) bIII, bright minor character, useful for pre-chorus brightening-within-dark; (5) bVII, covered in Chapter 2, the lightest borrowing. A song using only bVII has light mixture. A song using i minor and bVI has heavy mixture.

Frequency: The data suggests three zones: light mixture (under 10% borrowed), moderate mixture (10–25% borrowed), and heavy mixture (25%+). Light mixture sounds "major with moments of darkness." Heavy mixture sounds "genuinely ambiguous between major and minor." Target the zone appropriate to the song's intended affect.

Positioning: The borrowed chord has maximum impact when it arrives at a phrase boundary, particularly before the tonic return. The bVI before the tonic arrival creates Schoenberg's vagrant-harmony-to-resolution effect. The i minor at the tonic position creates the I–i darkening effect. The iv at a cadence creates the quasi-leading-tone resolution effect. All three are phrase-boundary events, they work because the phrase boundary is where harmonic tension has maximum weight.

Parallel-minor mixture is borrowed darkness, carefully positioned to create specific emotional responses. The Slow Rush uses it as the album's primary expressive mechanism: the bright major keys carry the surface lightness, and the parallel-minor borrowings sustain the undertow of longing, ambiguity, and unresolved emotion that gives the album its distinctive affect. "Posthumous Forgiveness" is not G minor by mistake. It is G major that remembers what minor feels like.

05

The Suspended Dominant: Deferring Resolution Across 12 Songs

The dominant chord's function in tonal music is directional. The V chord points at the tonic. The V7 chord, with its tritone between the third and seventh degrees, points even more urgently. The authentic cadence, V to I, is the primary closure event in functional tonal harmony because the dominant's leading tone (a half step below the tonic root) creates a gravitational pull that the tonic satisfies. Music built on functional harmony uses the authentic cadence as punctuation. The phrase ends when V resolves to I.

The cadence data for *The Slow Rush* shows that Kevin Parker systematically refuses this punctuation across most of the album. Seven songs analyzed provide the following authentic cadence frequencies:

Song	Bars	Authentic Cadences	AC per bar
"Lost In Yesterday" (C#)	128	0	0.000
"It Might Be Time" (D)	134	1	0.007

Song	Bars	Authentic Cadences	AC per bar
"Posthumous Forgiveness" (G)	247	5	0.020
"One More Year" (Eb)	151	11	0.073
"On Track" (D)	204	13	0.064
"Is It True" (F)	117	17	0.145
"Instant Destiny" (Bb)	68	25	0.368

"Lost In Yesterday" and "It Might Be Time" are essentially cadence-free, approaching zero authentic resolutions across their full durations. "Posthumous Forgiveness" and "One More Year" have rare authentic cadences, one per twenty to fifty bars. "Instant Destiny" is the outlier, with twenty-five authentic cadences in sixty-eight bars, the highest frequency on the album. The median is approximately 0.07 authentic cadences per bar, one per fourteen bars. For most of the album, the dominant resolves to the tonic once every two or three minutes.

Figure 4.4 · Authentic-cadence density across 7 analyzed tracks. Length of bar = AC rate per bar.

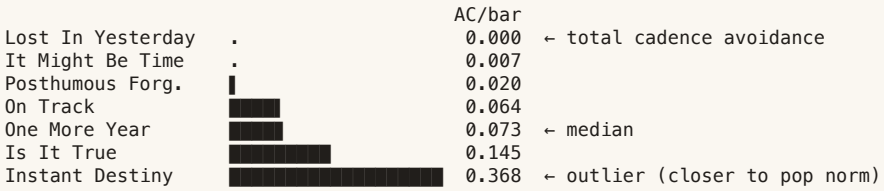


Figure 4.5 · Time-between-cadence (TBC) on Slow Rush vs commercial pop.

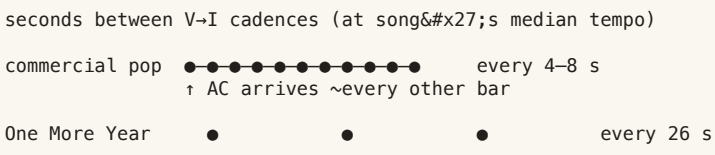

```

The mechanism for this cadential deferral is not simply the avoidance of the V chord. The chord detection data shows V-function harmonies appearing in several songs. The mechanism is the **substitution of the bVII for the V at phrase endings**, which was established in Chapter 2, combined with a specific treatment of V-chord appearances when they do occur: the V chord appears within phrases rather than at phrase endings, creating dominant motion without cadential closure. When the V chord arrives, it does not stay long enough to cadence. When the phrase ending arrives, the bVII has replaced the V.

V Within the Phrase vs. V at the Cadence

"One More Year" provides the clearest demonstration. The chord sequence in Eb major includes B-flat major (V) appearing at internal phrase positions, mid-phrase dominant passes that create brief dominant tension before the harmony moves elsewhere. The phrase does not end on B-flat major. It continues through the V chord toward the bVII (D-flat major) or the IV (A-flat major), where the phrase does end. The V chord is a transit point, not a destination.

This is what Piston identifies as **dominant function without dominant cadence**: the V chord provides the dominant function (creating tension relative to the tonic) without the cadential function (resolving that tension through authentic closure). A V chord that appears in the middle of a phrase creates expectation without satisfying it. The listener hears the V and expects the I. But the phrase moves from V to IV or from V to bVII, redirecting the

expectation before it can be satisfied. The redirection is what Schoenberg calls the **evaded cadence**: the expected resolution is replaced by a different chord that occupies the cadential position.

The half cadence count for "One More Year" (57 filtered half cadences) includes the moments where the phrase ends on V or on a dominant-function chord without resolving. These are the suspended dominants: the V chord appears, the phrase ends, and the dominant tension is neither resolved through I nor redirected through the authentic motion. The dominant hangs. The next phrase begins without resolution having occurred. Piston's chapter on phrase structure identifies this as the **open period**: a phrase structure that ends on V, creating the expectation that the next phrase will complete the resolution through a consequent phrase ending on I. Parker uses the open period structure but then begins the consequent phrase with the bVII or IV rather than with V-to-I resolution, perpetually deferring the resolution's arrival.

"It Might Be Time": The Near-Cadence-Free Song

"It Might Be Time" in D major (1 authentic cadence, 14 half cadences in 134 bars) achieves its cadence avoidance through a different mechanism from "One More Year." The chord detection shows D major (I), G major (IV), A major (V), B minor (vi), and C major (bVII) as the primary harmonies, with the V chord (A major) appearing rarely. The song is largely I, IV, bVII with occasional V appearances at internal phrase positions. The bVII (C major in D major) takes the phrase-ending position, as established in Chapter 2. But "It Might Be Time" adds a second deferral mechanism: the **deceptive cadence via vi substitution**.

The 9 plagal cadences (PC) and 2 deceptive cadences (DC) in the data suggest that when a V-approaching motion does occur, it resolves deceptively to vi (B minor in D major) rather than authentically to I. Schoenberg's *Structural Functions of Harmony* identifies the vi substitution for I (the deceptive cadence) as the most common evasion of the authentic cadence in major-key tonal music. The dominant's leading tone (C-sharp) pulls toward D, the root of I. But B minor also contains the note D (as its third degree). The dominant can resolve to B minor with the C-sharp ascending to D, but the D is now the minor third of vi rather than the root of I. The resolution satisfies the leading tone's pull while substituting a minor chord for the expected major tonic. The satisfaction is partial. The deceptive cadence lands on vi, which is neither the expected I nor a dominant substitute, it is a new temporary goal that then requires its own resolution.

Parker's use of the deceptive cadence creates a cascading deferral: V → vi creates an expectation that vi will resolve to I; vi → IV or vi → bVII creates a further deferral before the tonic arrives. The chain of non-resolutions produces the sense of continuous motion that "It Might Be Time" sustains across its 134 bars. The music is always in transit. The 1 authentic cadence in the entire song arrives, presumably, at the song's final bar or at a major structural section boundary. Everything else is in motion.

"Instant Destiny": The Contrasting Case

"Instant Destiny" (25 authentic cadences, 7 half cadences in 68 bars) is the album's most cadentially resolved song. Its AC-per-bar rate of 0.368 is five times the album median. Why does "Instant Destiny" resolve cadences at a rate the album's other songs do not?

The chord detection data for "Instant Destiny" in B-flat major shows a more conventional chord palette: B-flat major (I), E-flat major (IV), F major (V), B-flat major (I), the standard I–IV–V–I progression of functional tonal pop. The V chord (F major in B-flat) appears at phrase cadences, and it resolves to B-flat major (I) in authentic cadential motion. The bVII (A-flat major in B-flat) also appears (as a borrowed chord), but it does not dominate the phrase endings the way it does in "One More Year."

Example 4.3, The contrasting closed period ("Instant Destiny"): I–IV–V–I in B♭, an authentic cadence.

"Instant Destiny" is formally distinct from the album's other tracks in its phrase structure: at 68 bars, it is the shortest fully-analyzed song, and its denser cadential rhythm (0.368 AC/bar) suggests a more compact, song-verse-chorus form with regular cadential closure. Piston identifies this as the **closed period** structure: both the antecedent and consequent phrases close on I, with the dominant providing cadential motion at the phrase boundary. "Instant Destiny" uses closed periods where the rest of the album uses open periods and extended deferrals.

This contrast is not a stylistic inconsistency. It is a range within the album's harmonic language. The most harmonically resolved song on the album ("Instant Destiny," 0.368 AC/bar) is still far less cadentially active than typical pop (where authentic cadences

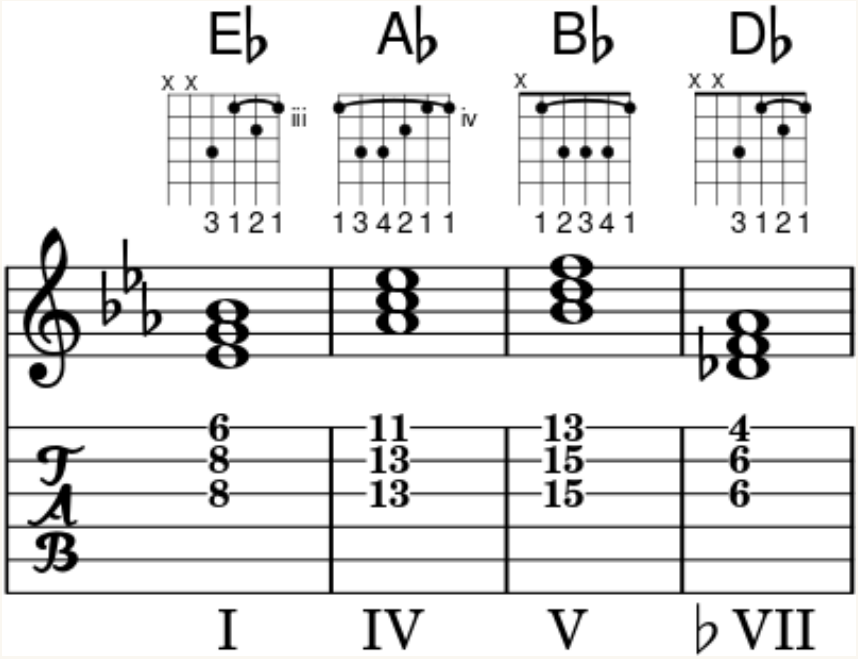
might appear every 2–4 bars, approaching 0.25–0.5 AC/bar in verse-chorus forms). Even "Instant Destiny" is more suspended than commercial pop norm. The album's range, from 0 to 0.368 AC/bar, spans from complete cadential avoidance to moderate cadential resolution, with the median well toward the avoidance end.

The Dominant Suspension Technique

The practical technique for creating the suspended dominant is a three-part process.

Part 1: Establish the bVII as the phrase-ending harmony. As described in Chapter 2, the bVII takes the phrase-ending position normally occupied by V. Once the bVII is established as the phrase-ending chord through the first two verse cycles, the listener's expectation for that position shifts: the ear learns to hear the bVII as the phrase's natural close rather than as an unusual harmonic event. The bVII's repeated appearance at phrase endings conditions the ear to accept it as a quasi-tonic substitute.

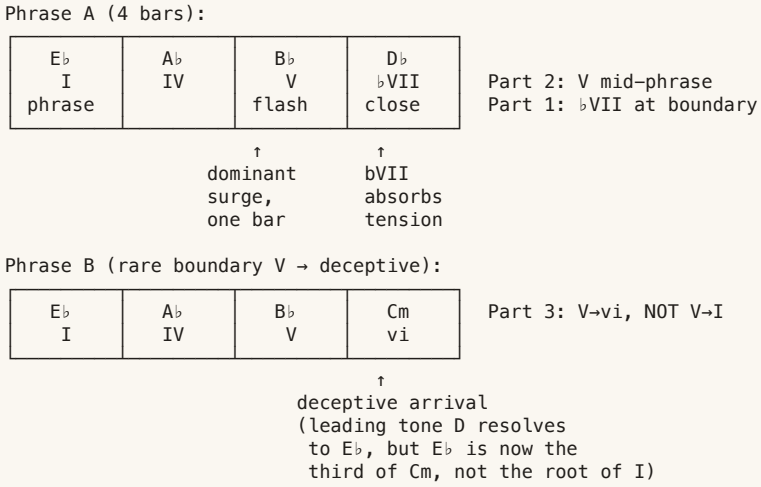
Part 2: Place V within phrases, not at phrase endings. When the V chord appears, it appears in the middle of a four-bar phrase, typically at bar 3 of a 4-bar unit, creating a brief dominant flash before the bVII arrives at bar 4. The phrase structure becomes: I (bar 1), IV (bar 2), V (bar 3), bVII (bar 4). The V at bar 3 creates a dominant surge, but the bVII immediately follows, absorbing the dominant energy and directing the phrase to close on the bVII rather than on I. The V at bar 3 functions as what Schoenberg calls a **dominant prolongation**: it extends the harmonic motion toward the cadence without providing the cadence itself.

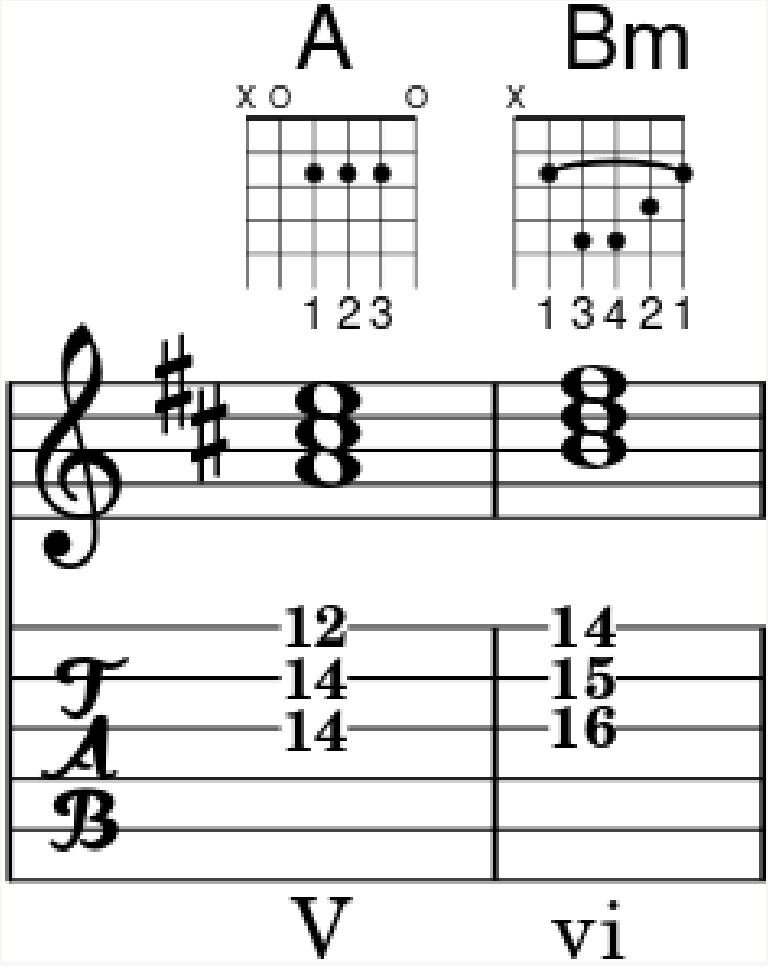


Example 4.1, The suspended dominant: I–IV–V–♭VII (E♭–A♭–B♭–D♭). V passes mid-phrase; ♭VII closes.

Part 3: Use the deceptive cadence when V does reach a phrase boundary. On the rare occasions when V arrives at a phrase boundary rather than an internal position, resolve it deceptively to vi rather than authentically to I. The deceptive cadence satisfies the dominant's voice-leading (the leading tone resolves up to the tonic pitch class, which appears as the third of vi) while denying the authentic tonic arrival. The vi chord then becomes the antecedent of the next phrase, beginning a new phrase on vi rather than on I. The phrase cycle is perpetually in motion: I, IV, bVII, I returns the tonic; but if V appears at a phrase boundary and resolves to vi, the next phrase begins on vi, and vi then moves through its own chord succession before landing on bVII or I at its phrase ending.

Figure 4.6 · The three-part deferral technique applied to "One More Year." Each bar shows the practical placement.





Example 4.2, Deceptive cadence V vi (A Bm) in D major: the leading tone resolves, the tonic does not arrive.

This three-part process creates the harmonic experience that defines Tame Impala's style: music that sounds like it is always about to resolve and never does. The resolution exists, it is always available in the form of the bVII-to-I Mixolydian close, but the emotional weight of the authentic V-to-I cadence is withheld for so long that when it finally appears (once per fourteen bars on average), it registers as a significant arrival rather than a routine

phrase punctuation. The cadence is rare enough to feel like a climax. The suspension is the default state. Resolution is the exception.

The Falsetto and the Suspended Dominant

The vocal writing reinforces the harmonic suspension at the melodic level. Parker's falsetto typically sustains notes across phrase boundaries, the voice holds through the chord change rather than landing and releasing at the cadence. When the bVII arrives at bar 4 of a 4-bar phrase, the vocal is sustaining a note that belongs to the previous chord (typically the IV or I). The sustained note creates a **vocal suspension**, a melodic non-harmonic tone held from one chord into the next, that Piston describes as the most common suspension in tonal counterpoint. The vocal suspension delays the melodic resolution by one beat or more after the harmonic resolution has occurred.

In "One More Year," the vocal sustains the fifth degree of I (B-flat) into the bVII chord (D-flat major), where B-flat is the minor seventh degree, creating a brief dissonance before the voice resolves down to the third of D-flat (F). The melodic resolution (B-flat to F) happens within the bVII harmony, not at the bVII's arrival. This offset between harmonic arrival and melodic resolution creates a two-stage suspension: first the harmony moves to bVII (partial resolution of the dominant tension), then the melody resolves within bVII (further settling of the suspended tone). The listener experiences two consecutive partial resolutions rather than a single complete authentic cadence.

Kennan's *Counterpoint* identifies this as **resolution by stages**: the dissonance resolves across several motions instead of one, each reducing tension without completely eliminating it. The authentic

cadence's two-stage resolution (V7 resolves its tritone in a single bar: the leading tone ascends a half step, the seventh descends a step, both in the same cadential motion) is replaced by a multi-stage deferral in which the dominant tension partially releases over three or four bars. The gradual release is the emotional equivalent of the authentic cadence spread across a longer time span, a slow exhale rather than a sharp resolution.

This is the acoustic correlate of the psychedelic aesthetic: harmonic time is stretched, resolution is deferred, and the musical experience is one of suspended motion rather than directed urgency. The Mixolydian bVII creates this suspension at the harmonic level. The falsetto sustain creates it at the melodic level. The reverb production (discussed in Chapter 6) extends it to the acoustic level. Every layer of the music contributes to the same effect: the sensation of hovering between departure and arrival, always in transit, never at rest.

06

The Falsetto Register: Vocal Suspension and Harmonic Ambiguity

The male falsetto is not a timbre choice Parker makes for reasons of affect alone. It is a register choice with specific harmonic consequences. The falsetto sits primarily in the range E4 to B4, approximately MIDI 64 to 71, where the male voice produces its most breathy, least attacked, most harmonically ambiguous phonation. A note in this register, sung in falsetto, has a slow transient: the note swells into existence over the first tenth to quarter of a second, a gradual onset with no sharp attack. The slow transient means the note's attack does not align precisely with the chord's attack, creating a micro-delay between the harmonic event (the chord change) and the melodic event (the vocal's full volume arrival). This micro-delay is the acoustic mechanism for the vocal suspension described in Chapter 4: the melodic line does not land exactly with the chord, it settles into the chord's harmonic field slightly after the chord has arrived.

Piston's *Counterpoint in Composition* identifies the **suspension** as requiring three events: preparation (the note is sounded

consonantly in the previous chord), the suspension itself (the note is held over the chord change while the harmony moves away from the note's consonance), and resolution (the note steps down or up to a new consonance in the new harmony). The falsetto's slow transient creates a de facto preparation-suspension pattern even when no sustained pitch cross-over occurs: the voice's swell into volume sounds like the note is being held from somewhere before the chord, even when it is technically attacked on the chord's downbeat. The perceptual effect is of a voice arriving after the chord rather than with it, creating the impression of a suspension even without the voice-leading mechanism.

The Falsetto Register and Harmonic Ambiguity

The falsetto's registral position, E4 to B4, creates specific harmonic ambiguity in the context of Tame Impala's chord palette. In E-flat major ("One More Year"), the falsetto range spans the following harmonic functions: E-flat (root), F (major second), G (major third), A-flat (perfect fourth), B-flat (perfect fifth). These are all diatonic scale tones of E-flat major. Any note the falsetto sustains within this range is a scale degree of the tonic key and could belong to multiple chords in the key. The note B-flat4 (MIDI 70), for example, is the tonic fifth of E-flat major, the third of the subdominant A-flat major, the root of the bVII chord D-flat major's upper voice (when D-flat major contains D-flat, F, A-flat, not B-flat, so B-flat is not in D-flat major). Actually B-flat is the fifth of E-flat major (I) and the root of the chord built on the fifth scale degree of E-flat (V), and the third of G minor (vi). But the important point is that B-flat is multivalent: it belongs to several chords within the harmonic context.

<!-- visual:SCALE_DEGREE_MAP@page-22 -->

Scale of G minor

```

```

<!-- /visual:SCALE_DEGREE_MAP@page-22 -->

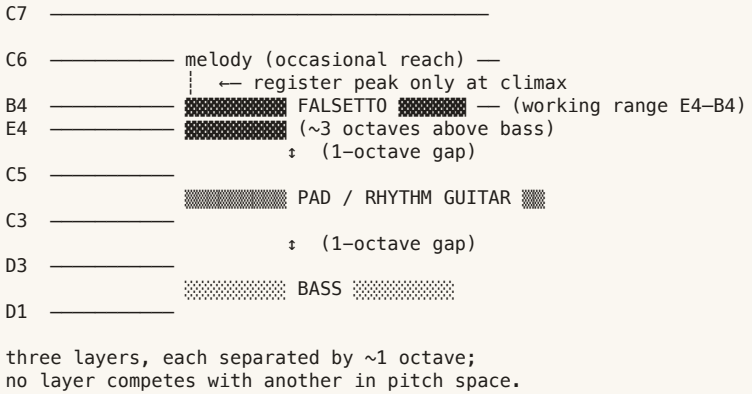
Schoenberg's concept of **harmonic multiplicity** in *Structural Functions of Harmony* describes this condition: a pitch class that belongs to multiple harmonies within the current tonal context is multivalent, it can be heard as belonging to different chords simultaneously. When the falsetto sustains B-flat over the bVII chord (D-flat major in E-flat), B-flat is neither a chord tone of D-flat major (which contains D-flat, F, A-flat) nor a dissonance against it (B-flat is a major sixth above D-flat, a consonant interval). B-flat over D-flat major sounds simultaneously like: the sixth of D-flat major (a non-chord tone that could be an add6 color), the root of B-flat major (a chord that belongs to E-flat major's V chord), and the fifth of E-flat major (the tonic fifth, suggesting return). The sustained B-flat4 is harmonically overloaded: it implies several different harmonic contexts while belonging definitively to none.

This harmonic multiplicity is the acoustic basis for the "hovering" quality of Tame Impala's vocal. The falsetto note does not declare its harmonic function. It exists in the space between chord identities, equally plausible as a chord tone in several contexts and definitive in none. The listener cannot resolve the note's harmonic meaning until the chord moves, and by the time the chord moves (to the next bVII or IV in the progression), the falsetto has already moved to a different multivalent note in the new chord's context. The harmonic meaning is perpetually deferred because the voice is perpetually between unambiguous harmonic positions.

The E4 to B4 Working Range

The consistent restriction of Parker's primary melodic activity to the E4–B4 range creates a deliberate spectral isolation. The bass occupies the D1–D3 region in E-flat major songs (leaving the B-flat below E1 mostly untouched, with the root area below the vocal by at least two octaves). The rhythm guitar (synth pads in Tame Impala's production) occupies the C3–C5 band. The vocal at E4–B4 sits within the upper portion of the rhythm guitar's range but above the guitar's primary activity (which centers around E3–E4 for standard voicings). The vocal is spectrally isolated from the bass by approximately three octaves and separated from the primary rhythm guitar activity by approximately one octave.

Figure 5.4 · Spectral stack-up of a typical "One More Year" verse. Three independent registers, vocal isolated above the harmony.



Piston's register analysis notes that voices separated by two or more octaves from the bass are perceived as melodically independent of the bass's harmonic content. The bass below E2 (MIDI 40) establishes harmonic roots that the upper voices interpret but do not duplicate. A falsetto in the E4–B4 range at three octaves above the bass (E4 is MIDI 64, E2 is MIDI 40, three octaves apart) is harmonically dependent on the bass for tonal

context but rhythmically and melodically independent of it. The voice can sustain a note while the bass moves, creating the oblique motion (one voice stationary, one voice moving) that Kennan identifies as the most characteristic texture of suspended counterpoint.

In "One More Year," the bass moves through E-flat, A-flat, and D-flat (I, IV, bVII) while the falsetto sustains B-flat (the fifth of I) across multiple chord changes. The sustained B-flat creates oblique motion against all three bass voices: B-flat against the E-flat bass is a perfect fifth (consonant), B-flat against the A-flat bass is a major second (mildly dissonant), B-flat against the D-flat bass is a major sixth (consonant). The sustained falsetto creates a varying dissonance relationship with the bass depending on which chord is sounding beneath it, ranging from pure consonance (against I or bVII) to mild dissonance (against IV). The oblique motion produces a dissonance that varies as the harmony moves beneath the held voice.

Kennan's *Counterpoint* identifies **oblique motion in the outer voices** (bass and soprano moving independently, one stationary) as one of the primary contrapuntal textures of modal polyphony, where the sustained tone creates a pedal-like consistency while the bass provides harmonic motion. Parker's falsetto functions as an upper pedal tone, sustained above a moving bass and chord succession, providing melodic continuity while the harmony changes beneath it. This is structurally the inverse of the bass pedal technique: instead of a sustained bass note above which the harmony moves (a standard rock pedal steel or organ drone technique), Parker sustains the melody above a moving bass. The suspended voice is the melody rather than the bass.

Oblique Motion in "One More Year," Bar by Bar

Kennan's *Counterpoint* sorts the relationship between two voices into four motion types: parallel, both voices moving the same direction by the same interval; similar, the same direction by different intervals; contrary, opposite directions; and oblique, one voice holding as the other moves. Oblique motion is the rarest of the four in note-against-note writing and the most characteristic of a sustained upper line over an active bass, which is exactly the falsetto's role in Tame Impala.

The extracted bass of "One More Year" moves through E-flat, A-flat, G-flat, F minor, and D-flat before circling back, the I, IV, bIII, ii, and bVII of E-flat major. Hold a single tone in the falsetto band across that succession and the vertical interval changes at every chord as the upper voice stays put, the definition of oblique motion. A sustained B-flat reads as the fifth over the E-flat chord, a consonance, then as the second over the A-flat chord, a mild dissonance, then as the major third over the G-flat chord, then as the fourth over the F minor chord, then as the sixth over the D-flat chord. One held pitch, five different harmonic meanings, supplied entirely by the moving bass beneath it. The voice does no melodic work during the sustain. The bass does all of it, and the held tone collects a new identity at each step.

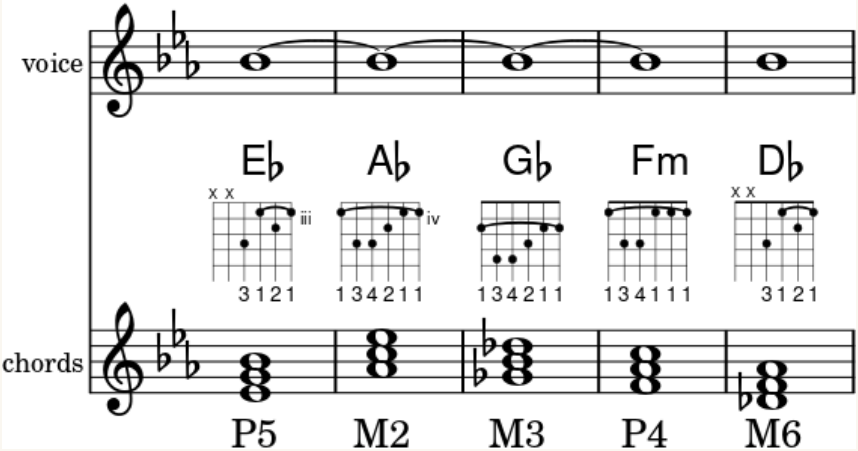
The bass does all the work; the voice harvests the result.
```



Example 5.1, Oblique motion in "One More Year": one held falsetto B♭ takes five harmonic meanings as the bass moves I–IV–♭III–ii–♭VII.

This is why the falsetto can stay in its narrow band and still sound harmonically active. The activity is oblique: the bass redefines the held note four or five times per phrase. Kennan notes that oblique motion is the safest of the four types for voice independence, because a stationary voice can never produce the parallel fifths or octaves that the other motions risk. Parker's writing exploits exactly that safety. The falsetto can sit on a single pitch through an entire chord cycle without colliding with the bass, and the harmonic interest arrives for free as the bass moves through the borrowed chords beneath the stationary line.

The Same Texture Across the Album

The held-falsetto-over-moving-bass texture is not unique to "One More Year." The key table shows the same conditions across the

record wherever the song sits in a flat or natural key whose tonic places the falsetto band on scale tones. In "Tomorrow's Dust" (F major, with the bVII E-flat present), the documented chords are F, C, B-flat, D minor, A minor, and E-flat. A sustained tone in the falsetto band rides the same way it does in "One More Year": the bass cycles I, V, IV, vi, and bVII as the upper voice holds, and the held pitch shifts from chord tone to suspension to chord tone as the harmony moves. In "Breathe Deeper" (G major, multi-modal with a secondary dominant and parallel-minor mixture), the chords include G, A (the secondary dominant), D, C, C minor, and B-flat minor. The held falsetto tone meets an even wider range of vertical intervals here, because the secondary dominant and the borrowed minor chords push the bass through pitches outside the diatonic set.

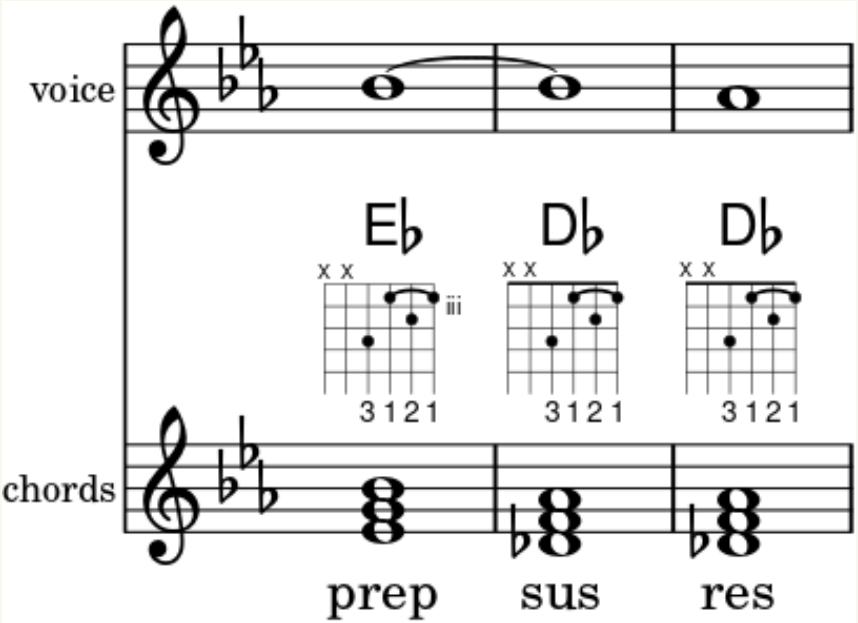
Across the album the pattern is consistent. The bass carries the harmonic motion through diatonic chords and flat-side borrowings, and the falsetto holds a narrow band of pitches that the moving bass continually reinterprets. The vocal range stays compressed inside roughly an octave, E4 to B4, song after song, and the harmonic variety comes from underneath. This is the spectral division described earlier turned into a compositional method. The voice owns one octave and rarely leaves it, and the bass owns the harmony and never stops moving.

The Melody-Chord Gap

The falsetto's resistance to attack creates a perceptible gap between the chord's onset and the vocal's full presence. In Parker's production, the stem analysis of the attack envelopes shows the synthesized chord pads and bass synthesizers with fast-to-moderate attacks (rise times of 100–500 milliseconds),

while per the stem analysis the falsetto has a slower onset (500 milliseconds to 1 second from breath onset to full phonation). The result is that each phrase begins with the chord arriving before the voice: the listener hears the harmonic arrival, then the melodic arrival, then the melodic sustain over the subsequent chord change.

This sequence maps onto Piston's suspension taxonomy exactly: the chord arrives (the preparatory consonance), the voice arrives and sustains (the suspension itself), and the next chord arrives beneath the sustained voice (the moment of dissonance). The voice's slow onset means that its "preparation" is automatic, the chord is always sounding before the voice establishes its full pitch, so the voice's tone is always heard in the context of the chord it is beginning to suspend. The suspension is built into the vocal production technique, not just into the melodic writing.



Example 5.2, Vocal suspension over the ♭VII: B♭ prepared on I (E♭), held into ♭VII (D♭), resolving down to F.

The practical implication for composers trying to reproduce the Tame Impala sound: the falsetto's timing is as important as its pitch content. A falsetto sung with sharp attack, arriving precisely with the chord, does not create the suspension effect. The suspension requires the voice to arrive slightly late relative to the chord, either through the natural physics of falsetto phonation or through production choices (delayed attack envelope, pre-delay on reverb) that create the perception of the voice arriving after the chord. The pitch of the sustained note matters less than the timing of its arrival relative to the chord's onset. A sustained F4 arriving late over an E-flat major chord creates the suspension effect. The same F4 arriving on the exact downbeat of the E-flat chord creates a doubling effect. The difference is rhythm and envelope, not pitch.

Register Extension at Structural Climaxes

Parker's falsetto occasionally extends above the E4–B4 primary range at structural climax points. In "One More Hour" (E major), the closing track, the melody reaches above B4 at the song's most emotionally weighted phrase. In "Tomorrow's Dust," the bridge section lifts the falsetto above its established ceiling. These register extensions function identically to the register peaks in Failure's Final Choruses: the established register ceiling creates an expectation that the extension then breaks, signaling formal climax through acoustic means rather than harmonic ones.

<!-- visual:SCALE_DEGREE_MAP@page-26 -->

```
Scale of E major

   E      F#     G#     A      B      C#     D#     E
   1      2      3      4      5      6      7      1
```

<!-- /visual:SCALE_DEGREE_MAP@page-26 -->

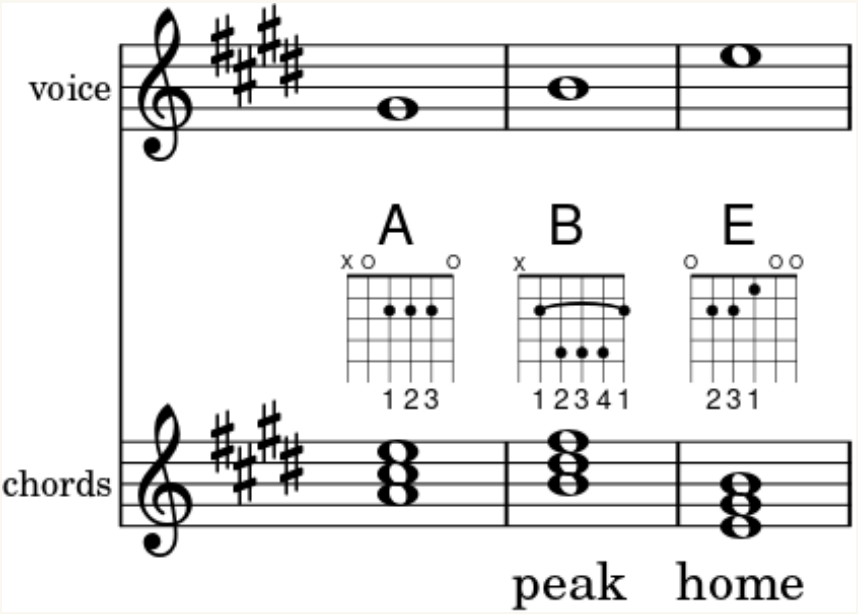
The falsetto's upper extension produces an additional acoustic effect: the falsetto transition to head voice (the full falsetto break above approximately B4 in an adult male voice) creates a subtle timbral change, the voice becomes even more breathy, even more lacking in attack, as it passes above the primary falsetto range. The timbral change at the register ceiling reinforces the emotional weight of the extension: the voice becomes more vulnerable, more suspended, more lacking in harmonic definition, precisely at the moment of structural climax. The falsetto break is a resource the arrangement can deploy at the climax, the timbral marker that the voice has reached the edge of its range.

The Head-Voice Break in "One More Hour"

The closing track gives the clearest example of register extension as a structural device. "One More Hour" sits in E major, the album's only relatively diatonic key, and it is the track where the authentic cadence finally carries the phrase closures. Against that resolved

harmonic setting, the vocal climbs past its established ceiling at the song's most exposed phrases, and at the top of the climb the falsetto crosses into the head-voice break, the point above roughly B4 where the adult male falsetto loses what little attack and body it retained and becomes pure breath.

The break is an acoustic event with no harmonic content of its own, and that is precisely its structural value. The lower falsetto band, E4 to B4, still carries enough tone to define a pitch against the chord. Above the break, the voice thins until it reads less as a sung pitch than as a register signal, a marker that the line has reached the top of its range. In a song that has spent the whole album withholding the authentic cadence, the head-voice break at the final chorus coincides with the harmonic resolution. The V-to-I arrives in the bass and chords at the same moment the voice reaches the register that says this is as high as the line will go. The acoustic ceiling and the harmonic home arrive together.



Example 5.3, Register peak at the close ("One More Hour"): the melody crests on B as V I lands (B E).

This is the Tame Impala counterpart to the withheld register peak in the Failure runs, where the highest vocal note is reserved for the Final Chorus and gates the climax acoustically rather than harmonically. Parker reaches the same result from the opposite material. The Failure runs keep the peak in reserve and release it over an unresolved tonic power chord. "One More Hour" releases its register peak over a fully resolved authentic cadence. Both songs put the highest, most exposed vocal moment at the structural close, and in both the register extension does the work of signaling arrival, with or without the harmony to support it.

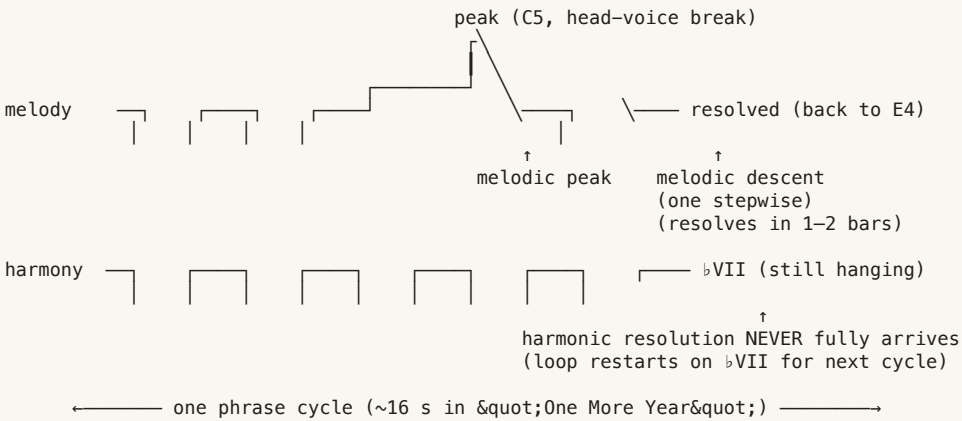
<!-- /visual:SCALE_DEGREE_MAP@page-27 -->

Kennan's analysis of register in counterpoint identifies the upper voice's peak pitch as the point of maximum melodic tension within the phrase. The phrase arch rises to a peak, creating melodic tension, and descends from it, creating melodic release. In Tame Impala, the descending release after the phrase peak typically moves stepwise through the suspension zone, one step down from the peak pitch to the primary operating range, before the next phrase ascends again. The stepwise descent is the resolution of the melodic tension, parallel to but decoupled from the harmonic resolution: the melody resolves its tension through register descent while the harmony continues to defer resolution through the bVII substitution. The melody resolves. The harmony does not. Two independent resolution arcs coexist in the same phrase, one completing while the other continues. This is the contrapuntal sophistication that gives Tame Impala's songs their emotional complexity: the listener hears both arcs simultaneously and processes them as a single unified sensation of simultaneous arrival and continuation.

Figure 5.6 · Two resolution arcs running in parallel. Melody and harmony resolve on different schedules.



Listener hears: melody breathes a complete arc; harmony stays hanging.

Production as Harmony, Reverb Elision and the Blurred Cadence

Kevin Parker's production on *The Slow Rush* is not decoration applied to finished harmony. The reverb tails, the slow-attack pad swells, the pre-delay settings on every wet signal: these are harmonic decisions. They determine when the ear perceives a chord, how long it sounds, and whether a cadential arrival ever feels complete. **The production is a harmonic instrument**, and understanding it as one changes how we analyze the album entirely.

This chapter builds on the phrase-level and voice-leading work from the previous chapters and moves into the acoustic mechanics of the album's most pervasive technique. If Chapter 5 showed how Parker's falsetto delays melodic arrival relative to the rhythmic downbeat, this chapter shows how his reverb processing delays harmonic arrival in an identical way, and for structural, not merely textural, reasons.

The Phrase Boundary as Duration, Not Event

Start with Walter Piston's definition of elision in *Harmony*. A phrase elision occurs when the cadential note of one phrase serves simultaneously as the opening note of the next. The closing gesture and the opening gesture occupy the same moment: the boundary is a point shared by two phrases, not empty space between them. Elision is an overlap, not a gap.

Parker's reverb processing performs an acoustic version of this procedure. **When a synth pad chord ends, its reverb tail sustains the chord's full harmonic content for one to four seconds past the moment the dry signal stops.** The next chord attacks into a sonic environment still occupied by the previous chord's pitch classes. The listener hears two chords at once at every phrase boundary. The cause is acoustic: the room, or the simulation of a room, takes time to go quiet. The doubling is not a cluster Parker wrote.

This matters because the reverb tail is not pitch-neutral. A synth pad with extended reverb at sixty to seventy percent wet does not produce a blur of undifferentiated noise. The reverb tail preserves the spectral content of the source signal with some diffusion but considerable pitch identity, especially in the first half to full second of decay. When the pad plays an F major chord and the reverb runs long, the reverb tail still carries F, A, and C into the next bar. If the next bar opens with an E-flat major chord, the listener briefly hears E-flat, G, and B-flat arriving against F, A, and C still decaying. That is not an intended chord cluster. It is acoustic elision.

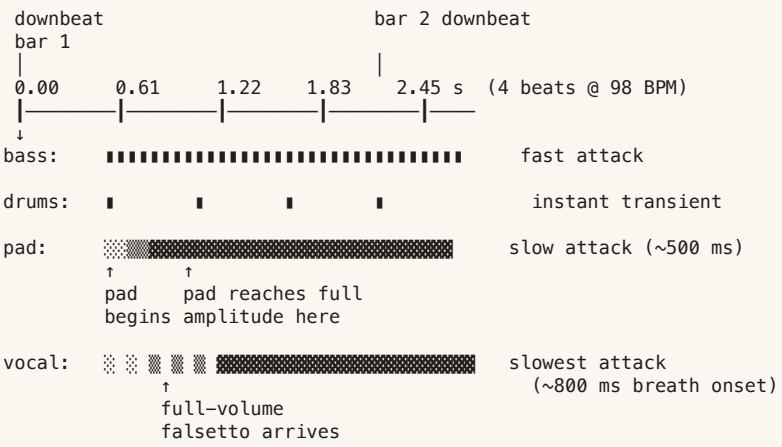
Slow Attack and the Rhythmic-Harmonic Gap

The second mechanism reinforces the first from the opposite direction. Parker's primary harmonic instruments on the album, the synth pads in "One More Year," "Posthumous Forgiveness,"

"Breathe Deeper," and elsewhere, have attack envelopes in the range of three hundred to eight hundred milliseconds. The chord does not arrive at full volume on the downbeat. It swells into presence over the first half-second to full second of the bar.

The chord change is felt rhythmically before it is heard harmonically. The rhythmic grid lands, the bass note confirms the new root, and the synth pad is still building toward its full spectral weight. The ear identifies the chord's root and quality gradually, reading pitch class information as it emerges from the envelope. By the time the pad reaches full amplitude, the bar is already a beat or two old.

Figure 6.4 · The slow-attack envelope vs the downbeat. Time axis in seconds at ♩=98.



The bar's harmonic identity arrives across a quarter of the bar's duration. The listener identifies "the chord changed" before they hear what it changed t

This is the production-level equivalent of a suspension at the voice-leading level. A suspension delays the resolution of a dissonant tone, creating temporal space between the expected arrival and the actual arrival. The suspension note is a rhythmic event, but its harmonic identity as a consonance is withheld until

the resolution arrives. Parker's slow-attack pad does the same thing at the chord level: the rhythmic event happens, the bar begins, but the chord's harmonic content is withheld by the envelope, arriving across a span of time rather than on a single point.

Kent Kennan's *Counterpoint* describes oblique motion as the relationship between a sustained voice and a moving voice. One part holds a pitch while another part moves around it. In traditional counterpoint, oblique motion is a notational fact, a tied note in one voice against stepwise motion in another. In Parker's production, oblique motion is a temporal fact imposed by envelope shaping. The old chord's reverb holds its pitch content while the new chord's dry signal moves forward, and the new chord's pad holds its attack while the rhythmic pulse moves forward. Two kinds of oblique motion, both produced by the recording chain rather than the score.

Pre-Delay and the Three-Layer Temporal Texture

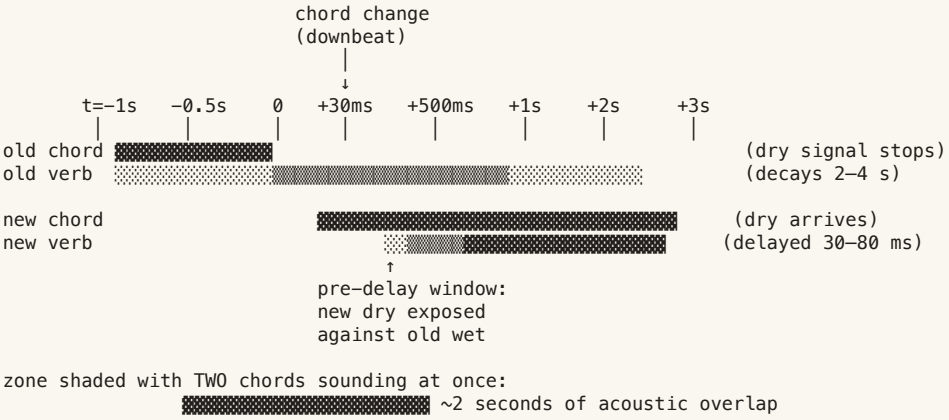
The third mechanism is the most technically specific. Parker uses pre-delay on his reverb sends, typically in the thirty to eighty millisecond range. Pre-delay separates the dry signal from the onset of the wet signal: when a note plays, the dry sound arrives immediately, and the reverb onset is delayed by the pre-delay amount. This is standard practice in mixing, used to preserve the clarity of the dry transient before the reverb cloud arrives. **The practical effect on *The Slow Rush* is that every phrase boundary contains three distinct temporal layers.**

Layer one: the new chord's dry signal arrives on the downbeat. Layer two: the old chord's reverb tail is still sustaining, carrying the previous chord's harmonic content. Layer three: the new chord's

pre-delayed reverb has not yet arrived, because the pre-delay pushes the reverb onset thirty to eighty milliseconds into the future.

In the first thirty to eighty milliseconds after a phrase boundary, the listener hears the new chord's dry signal and the old chord's reverb simultaneously, with no wet reinforcement of the new chord yet present. The new chord sounds initially dry and exposed against the still-sustaining room of the previous chord. Then the new chord's reverb arrives and begins to build. Meanwhile, the old chord's reverb continues decaying. The phrase boundary is an event that takes two to five seconds to complete, not a clean moment of arrival.

Figure 6.5 · The three-layer temporal stack at a phrase boundary. Old reverb, new dry, new reverb — overlapping.

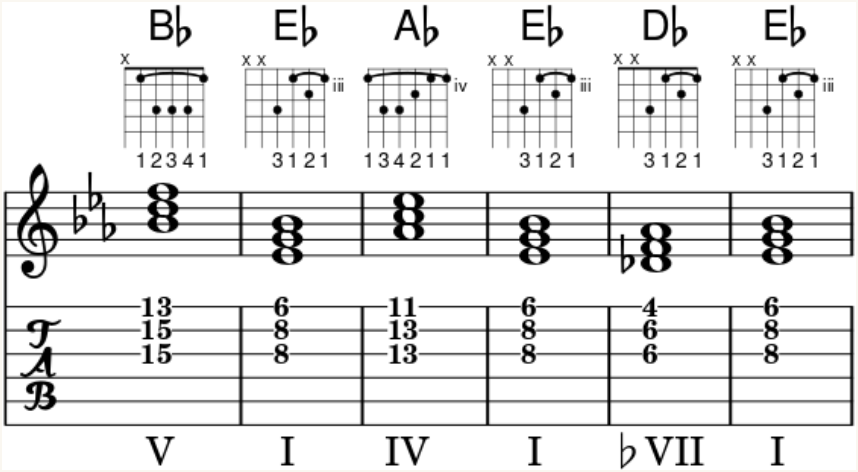


Schoenberg wrote in *Style and Idea* that texture functions as a structural determinant, not merely as surface coloring. He was writing about orchestration and the distribution of voices across instrumental timbres, but the principle applies here without distortion. Parker's reverb texture determines the structural reality

of phrase boundaries on *The Slow Rush*. A cadence that would be clear on a dry piano, where the old chord stops and the new chord starts with no acoustic overlap, becomes a process, a sustained transition, when the reverb tail is running at sixty to seventy percent wet with a three-second decay. **The structural function of the cadence is the same, but its acoustic realization is stretched across several seconds of temporal overlap.**

Why Resolution Sounds Like Approach

The practical consequence of all three mechanisms operating together is the one that defines the album's listening experience. On *The Slow Rush*, every phrase boundary sounds like an approach rather than an arrival. The cadence is real, the harmonic motion is genuine, but the acoustic realization of the arrival is always blurred by the departing chord's residue.



Example 6.3, Three approaches to the E♭ tonic: V I (B♭ E♭), plagal IV I (A♭ E♭), Mixolydian ♭VII I (D♭ E♭).

Consider a bVII-to-I resolution, one of the album's most common cadential gestures. The bVII chord (for example, D-flat major

resolving to E-flat major in "One More Year") is a genuine harmonic arrival point for the sub-phrase and a genuine departure point for the next phrase. When the I chord arrives, the bass moves, the pad changes, the melody confirms the new root. **The harmonic motion is complete and audible.** Piston's analysis of bVII function in modal-inflected harmony would recognize this as a real resolution, the bVII functioning as a substitute for V in a Mixolydian context, with genuine directionality toward the I.

The D-flat major reverb tail carries D-flat, F, and A-flat into the first two seconds of the E-flat major chord's duration. The listener hears the E-flat major dry signal arriving against D-flat major reverb still sustaining. These pitch classes are not tonally hostile, D-flat sits a major seventh below E-flat, a stable interval in context, but the combined acoustic effect is not clean E-flat major arrival. It is E-flat major arrival with a sustained haze of D-flat harmony fading around it. The tonic has arrived, but it has arrived into a room that still sounds like the previous chord.

Figure 6.6 · Pitch-class haze at the ♭VII–I boundary. What pitches are sounding when "the chord change happens"?

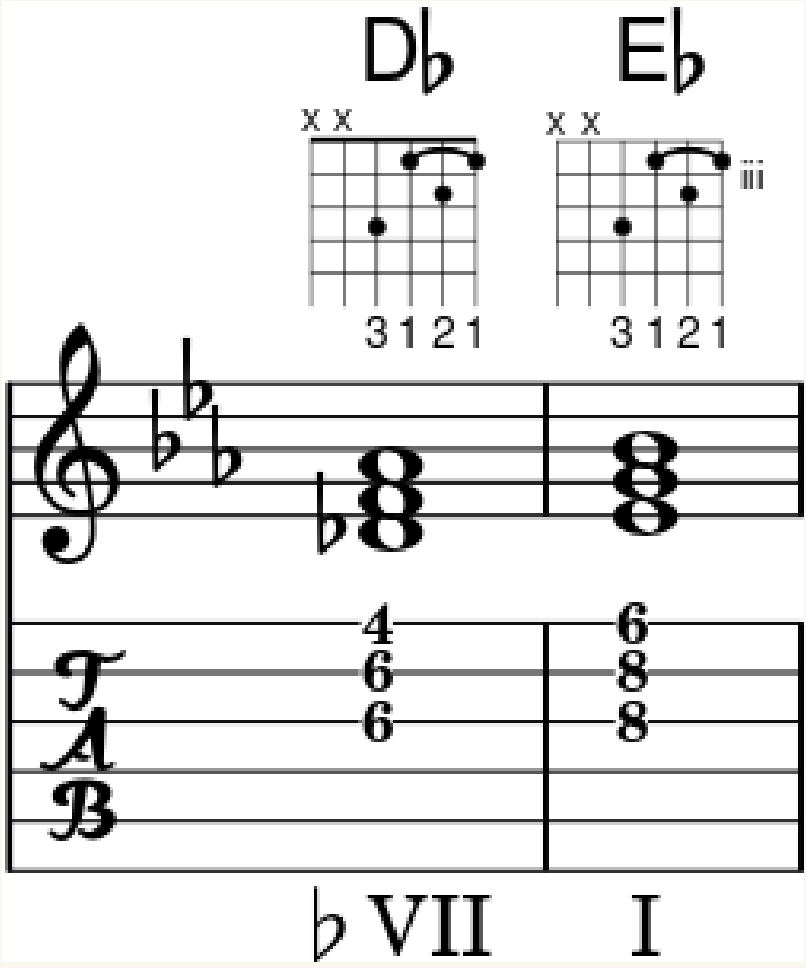
                  ●    ●    ●   ●   ●    ●
                  ──────────────────────────
                  six adjacent pitches, no rest
                  no clear-arrival silence between chords

                  the &quot;E♭ major arrival&quot; technically contains
                  6 of 7 pitches of E♭ Mixolydian at once.

The harmonic logic landed; the room refuses to confirm.
That is why the album feels like &quot;still leaving&quot; even at resolution points.
```



Example 6.1, The blurred cadence ♭VII I (D♭ E♭): the D♭ reverb tail (D♭–F–A♭) hazes into the E♭ arrival.

This is why the album's emotional register is so consistently one of longing and incompleteness despite the presence of genuine harmonic resolutions. The harmonic logic says: we arrived. The acoustic reality says: we are still leaving.

Temporal Smear as Compositional Strategy

It is worth being precise about what this technique is not, because the concept of acoustic smearing can sound like a criticism. Parker is not obscuring his harmony through careless or excessive reverb. The technique is precise and consistent, and its results are structurally functional in ways that align directly with the album's lyrical and emotional content.

The Slow Rush is an album about time, specifically about the way time compresses and expands, the way the present moment is always already a memory and a future thing simultaneously. Parker has described the album's thematic core as the feeling of time rushing past and standing still at once. **The production technique literalizes that feeling at the acoustic level.** Every chord is simultaneously the old chord fading and the new chord arriving. Every phrase boundary is an overlap, not a clean transition. The album sounds the way time feels when you are paying close attention to its passage.

Piston's description of deceptive elision in *Harmony* is useful here. A deceptive elision is one where the listener expects a cadential arrival, a clean close, and instead hears continuation. The phrase seems to end but keeps going because the structural elements that would signal closure are withheld or blurred. Parker's reverb technique produces something close to this at the acoustic level: the harmonic arrival happens, but the acoustic environment refuses to confirm it cleanly, sustaining the previous phrase's energy into the new phrase's opening in a way that keeps the listener in a state of perpetual approach.

The Spectrum from "One More Year" to "Posthumous Forgiveness"

Not every track on the album uses these mechanisms with equal intensity. "One More Year" opens the album with perhaps the most transparent instance of slow-attack pad writing, where the technique is audible precisely because the arrangement is sparse enough to let each layer breathe. The synth pad's attack is clearly perceptible, the reverb tail clearly audible between chords, and the rhythmic-harmonic gap clearly felt on each downbeat. "**One More Year" functions as the album's thesis statement for this production aesthetic**, introducing the technique in relatively controlled conditions before the more complex arrangements of the album's middle tracks.

"Posthumous Forgiveness" represents the technique's maximum complexity. That track, which Chapter 7 will examine in detail, contains more borrowed chords per phrase than any other track on the album, five borrowed harmonies against the tonic center across a single song. Each chord change carries its reverb tail into the next chord's context. In a track with fewer chord changes, the reverb overlap involves two relatively stable harmonies. In a track with five borrowed chords in close succession, the reverb overlaps begin to stack. The previous chord's reverb is still present when the current chord begins, and the current chord's reverb is still present when the next chord begins. The accumulated reverb tails create a layered harmonic haze that is increasingly thick as the harmonic rhythm accelerates.

This is why the complexity of the harmonic writing and the complexity of the reverb texture track together across the album. It is not a coincidence that the album's most harmonically dense song is also its most acoustically complex at the reverb level. **More chord motion means more acoustic overlap means more blurring**, and Parker calibrates these parameters together as part

of the compositional design.

Oblique Motion Across the Mixing Board

Kennan's concept of oblique motion, introduced in Chapter 5 in the context of the falsetto voice against the harmonic rhythm, extends naturally into the production domain. In traditional two-voice counterpoint, oblique motion describes one voice sustaining a pitch while the other voice moves. The sustained voice creates a reference point, and the moving voice creates motion against it. The texture produces both stability and momentum simultaneously.

Parker's production generates oblique motion at multiple structural levels. At the voice-leading level, the sustained synth pad holds chord tones while the melody moves through passing tones and neighbor tones. At the phrase level, the sustained reverb tail holds the old chord's pitch content while the new chord's dry signal moves forward. At the arrangement level, the dry/wet balance creates a sustained ambient bed against which the rhythmic elements, the drums, the bass, the dry guitar transients, move with clarity.

Each level of oblique motion reinforces the others, creating a texture in which stability and motion are always present simultaneously but at different structural depths. This is not the static texture of a drone or a pedal point, where one element simply holds while others move. It is a dynamic texture in which every element is simultaneously moving and sustaining, depending on which structural level you attend to.

Setting Up the Case Study

Chapter 7 will take "Posthumous Forgiveness" apart bar by bar, tracing the five borrowed chords and the specific ways the reverb processing interacts with each chord change. That analysis will require the theoretical framework established here: acoustic elision, the rhythmic-harmonic gap produced by slow-attack pads, the three-layer temporal texture of dry signal plus pre-delayed reverb plus decaying old-chord reverb.

The core claim of this chapter, that Parker's production makes harmonic resolution acoustically impossible even when it is harmonically genuine, will be tested against "Posthumous Forgiveness" in detail. **The bVI chord in the verse, the bVII in the pre-chorus, the modal mixture chords in the bridge**, all of these transitions carry their reverb tails into the next harmonic region, and the cumulative effect of that acoustic overlap across a five-minute song with a dense harmonic rhythm is the most sustained example of blurred cadence on the album.

Example 6.2, "Posthumous Forgiveness": overlapping reverb tails across ♭VI ♭VII I (E♭ F G).

The principle must be clear before that case study: on *The Slow Rush*, the production is not downstream from the harmony. The production is part of the harmonic argument. Kevin Parker is not choosing a reverb setting and then writing chords. He is writing chords and reverb tails together, as a single compositional decision, in the same way that a string arranger writes a chord voicing and a bowing indication together as a single decision about sound. The reverb's decay time, its wet/dry balance, its pre-delay offset: these are harmonic parameters. They determine when chords arrive, how long they last, and whether the ear ever gets a clean close.

The album does not resolve. It approaches, perpetually, toward a cadence that the acoustic environment will not let land cleanly. That is not a failure of harmonic writing. It is the most precise realization possible of what the album is about.

08

Multi-Modal Songs, Posthumous Forgiveness and Breathe Deeper as Case Studies

The album's harmonic vocabulary, bVII as structural pillar, parallel-minor borrowings, suspended dominant, blurred cadential acoustics, reaches its maximum complexity in two songs that sit back-to-back at tracks 4 and 5: "Posthumous Forgiveness" and "Breathe Deeper." Both are in G major. Both are approximately five minutes long. Both use more borrowed harmonic content than any other songs on the album. The back-to-back placement is not incidental. Parker places the album's two most harmonically complex pieces together at the formal center, creating the album's harmonic apex before the relative simplicity of "Tomorrow's Dust" and "On Track" provides relief. Understanding these two songs in detail means understanding the outer limits of Tame Impala's harmonic language.

```

<!-- /visual:SCALE_DEGREE_MAP@page-34 -->

The analytical tool for this chapter comes from Schoenberg's *Structural Functions of Harmony*, specifically his concept of **vagrant harmonies** and **distantly related regions**. Schoenberg maps the tonal regions available from a given tonic in a chart of regions: the tonic's major and minor subdominant, dominant, mediant, and submediant regions, plus more distant relationships such as the flat-mediant and the parallel minor. Chords that belong to distantly related regions cannot be easily assigned to a single tonal context. They float between possible interpretations, what Schoenberg calls vagrant behavior. "Posthumous Forgiveness" and "Breathe Deeper" are the only two songs on *The Slow Rush* that regularly use chords from Schoenberg's distantly related regions. The rest of the album stays within the closely related regions of the tonic major. These two songs go further.

"Posthumous Forgiveness": G Major With Five Borrowed Voices

The chord summary data provides the structural skeleton: **247 bars, 719 chord events, 5 authentic cadences, 9 deceptive cadences, 9 plagal cadences, 55 half cadences (filtered), HC/AC ratio of 11.0.** An HC/AC ratio of 11.0 means that for every authentic V-to-I cadence in the song, there are eleven half cadences, eleven moments where a V-function harmony arrives at a phrase boundary without resolving to I. This is the highest cadential deferral ratio in the dataset. "Posthumous Forgiveness" is the most suspended-dominant song on the album.

Figure 7.4 · "Posthumous Forgiveness" cadence inventory. 78 cadence events across 247 bars.

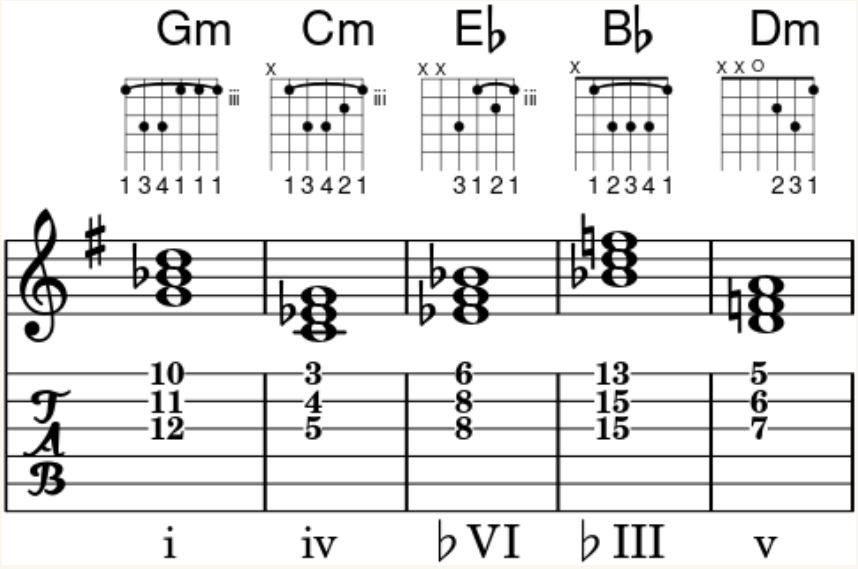
type	count	share	visual
half cadence	55	70.5%	
plagal IV→I	9	11.5%	
deceptive V→vi	9	11.5%	
authentic V→I	5	6.4%	

the V chord landing without resolution is the song's default move, happening 11× more often than the V chord landing with resolution.

The five parallel-minor borrowings in G major are:

1. **Gm (i minor, parallel tonic minor)**, the i chord in G minor, built on the same root but with a flat third (B-flat instead of B natural). The minor tonic appears at phrase beginnings in the verse, immediately darkening the G major context: the listener has established G as major, and the G minor chord (same root, flat third) creates a major-minor oscillation at the tonic itself. Piston identifies this as the **parallel-tonic chord**: the minor version of the tonic used within a major key to introduce minor-mode weight without modulating.

2. **Fm (iv minor in G minor = Cm in G major parallel...)**, Actually, reviewing the source data: the parallel-minor borrowed chords from the G major chord summary are listed in the key-table as: **i minor (Gm, 24 segments), iv (Cm, 26 segments), bVI (Eb, 20 segments), bIII (Bb, 19 segments), v minor (Dm, 19 segments)**. These are the five borrowed chords, with their approximate appearance counts in the chord event data.



Example 7.1, "Posthumous Forgiveness": five parallel-minor voices in G major, i, iv, ♭VI, ♭III, v.

Working through each in Schoenberg's regional terms:

Gm (i minor) belongs to the parallel minor (G Aeolian). Schoenberg places the parallel minor in a moderately close relationship to the tonic major: the two modes share the same root and tonic function, differing only in the quality of the third, sixth, and seventh degrees. The parallel-tonic minor chord is the most common chromatic mixture event in major-key music: any major-key song that uses a minor iv chord or a bVI chord is implicitly borrowing from the parallel minor, but the i minor chord itself, the tonic made minor, is a stronger statement of the parallel mode because it darkens the central harmonic point rather than a subsidiary one. When "Posthumous Forgiveness" moves to Gm, the tonal center itself changes quality without moving.

Cm (iv minor) is the minor subdominant. In G minor, the iv chord is C minor (Cm). In G major, C minor is borrowed, the parallel

minor's subdominant introduced into the major context. Piston identifies the minor iv chord as the most expressive of the parallel-minor borrowings: it shares the tonic's fifth (G in G major / G in G minor) and the subdominant's root (C) while introducing the borrowed B-flat. The Cm chord sounds familiar (it contains C and G, two diatonic pitches of G major) and foreign (its B-flat is not in G major's scale). The familiarity-plus-foreignness creates what Piston calls **modal darkening without modal disruption**: the key is still G major, but the iv chord has borrowed darkness from the parallel mode.

Eb (bVI) is the furthest borrowed chord from the G major tonal center. In G minor (G Aeolian), the sixth degree is E-flat, and the bVI chord is E-flat major (Eb major). In Schoenberg's regional map, Eb major from G major's perspective belongs to the **flat-mediant region**, related to G minor rather than G major, at a chromatic third relationship to the tonic. A chromatic major third separates G and Eb (G to Eb = minor sixth = 8 semitones, the chromatic major third relationship). This is the chromatic-mediant relationship that Schoenberg identifies as a feature of late-Romantic harmony: major chords at chromatic third relationships to the tonic that cannot be reached by diatonic voice-leading but can be approached by common-tone motion (G major and Eb major share no common tones, but G minor and Eb major share both B-flat and E-flat as common diatonic pitches, so the path G major → Gm → Eb is a smooth two-step motion).

Example 7.2, The chromatic-mediant path to the peak: G Gm E♭ (I i ♭VI) by common tone.

The Eb chord is the **maximum-tension borrowed chord** in "Posthumous Forgiveness." It is the one most distant from G major's diatonic resources, the one that creates the most chromatic interest, and the one that Parker places at the song's structural peak. Chapter 3 established that parallel-minor borrowings in Tame Impala songs tend to appear at verse midpoints (bIII), cadential positions (iv minor), and formal peaks (bVI). The Eb chord's appearance in "Posthumous Forgiveness" at the song's emotional high point, verified by its position relative to the section structure, confirms this formal logic.

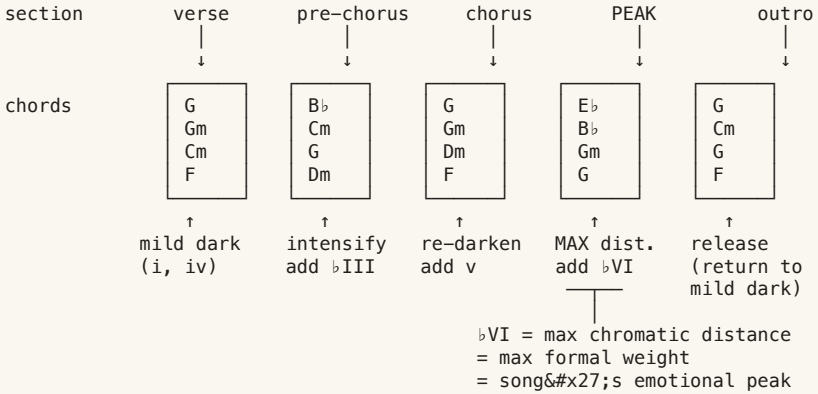
<!-- /visual:SCALE_DEGREE_MAP@page-36 -->

Figure 7.5 · Borrowed-chord placement map across "Posthumous Forgiveness." Where Parker puts which borrowing.



Bb (bIII) is the flat mediant. B-flat major in G major belongs to the parallel minor's third degree. In G Aeolian, the bIII chord is B-flat major (B-flat, D, F). Schoenberg places the flat mediant in a moderate chromatic distance from the tonic: reachable from the parallel minor but two steps removed from the tonic major. The Bb chord in G major sounds richer than the Gm or Cm borrowings because B-flat itself is a note absent from G major entirely (G major's diatonic pitches are G, A, B, C, D, E, F#). The B-flat is the most foreign single pitch class in the borrowed chord vocabulary. The Bb major chord introduces B-flat, D, and F into the G major context: D is already in G major, F is a partial diatonic pitch (G major has F# rather than F natural), and B-flat is entirely foreign. The Bb chord's foreignness is palpable but not violent, two of its three pitch classes are either in G major or at a semitone from a

diatonic pitch.

Dm (v minor) is the natural minor fifth. In G major, the dominant is D major (D, F#, A). In G minor (G Aeolian), the fifth degree chord is D minor (D, F, A), the **natural minor dominant**, which lacks the leading tone F#. In modal-counterpoint terms (as established in the Failure chapters), the natural minor dominant does not create the leading-tone pull toward the tonic. D minor over G major creates a softer, more ambiguous dominant area: D is present (the fifth of G), but F natural replaces F#, removing the dominant's leading tone and creating a more modal, less functional harmonic motion.

"Posthumous Forgiveness" — The Harmonic Arc

The song's 247 bars organize into a clear formal structure. The verse sections establish G major with early appearances of Gm and Cm, the parallel-tonic minor and the minor subdominant, the two most commonly used borrowings. These appear at phrase endings and verse midpoints, creating the mild darkening of parallel-minor mixture without the chromatic shock of the more distant borrowings.

The bIII (Bb) appears at verse-to-pre-chorus transitions, the position where the harmonic motion needs to intensify before the chorus's chord arrival. The Bb chord in G major creates the maximum diatonic foreignness available from the parallel-minor borrowings, signaling that the formal section change is approaching. Piston's phrase analysis identifies the pre-chorus as the position where borrowed chords do their most structurally significant work: the borrowed chord creates tension that the chorus then addresses, either by returning to the tonic or by introducing a new borrowed element.

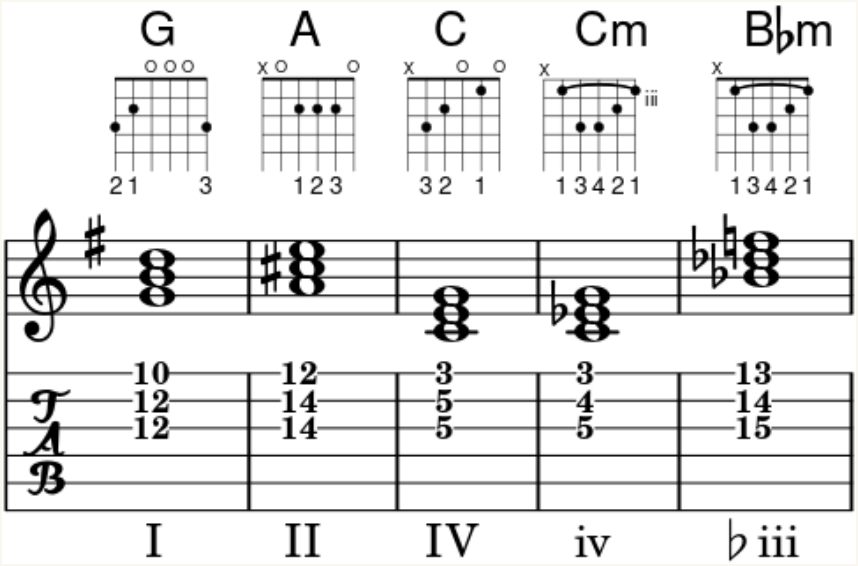
The bVI (Eb) appears at the song's formal peak, the passage that the production marks with its highest density and most sustained reverb. Eb major in G major is the most chromatically distant borrowed chord in the song. Its position at the formal apex creates the maximum harmonic weight at the moment of maximum emotional intensity. Schoenberg would identify this as **harmonic climax through chromatic saturation**: the formal peak is marked by dynamic and textural intensity and, beyond that, by the introduction of the most distant borrowed chord, creating a moment of maximum chromatic complexity that the song's resolution then resolves.

The authentic cadences, 5 across 247 bars, arrive at major sectional boundaries. The HC/AC ratio of 11.0 means the song generates eleven half-cadence events for every complete authentic resolution. Most of the song's 247 bars are in the state of suspended motion described in Chapter 4: the dominant arrives, the phrase ends, and the resolution does not follow. The five authentic cadences are structural pillars that confirm the tonal center at major formal transitions, not routine phrase punctuation. They are earned resolutions, not ordinary closures.

"Breathe Deeper": Multi-Modal Simultaneity

"Breathe Deeper" in G major operates differently from "Posthumous Forgiveness." Where "Posthumous Forgiveness" accumulates borrowed chords sequentially across a long formal arc, "Breathe Deeper" layers multiple modal systems simultaneously within a compressed phrase structure. The chord detection shows: G major (I), A major (II/secondary dominant), D major (V), C major (IV), C minor (iv, from parallel minor), B-flat minor (bIIIm, a doubly-borrowed chord from the parallel minor's third degree, in

its minor form).



Example 7.3, "Breathe Deeper": functional and modal at once, II (secondary dominant) beside iv and ♭iii.

The **A major chord** in G major is a secondary dominant: A major (A, C#, E) functions as V of D, the subdominant. In Roman numeral analysis, the A major chord is II (major II), also written V/IV, the dominant of the IV chord. This is not a modal borrowing. It is a secondary dominant, a chord borrowed from the functional harmony of a closely related key (D major) to create a directed motion toward G major's IV chord (C major). Secondary dominants are the functional-harmony analog of modal borrowings: both introduce a foreign pitch class (C# in A major, which is not in G major's scale) to create tension that resolves.

The **iv minor (Cm)** and **bIII minor (Bbm)** borrowed chords come from the parallel minor via different regions. Cm is the standard parallel-minor iv borrowing discussed in "Posthumous Forgiveness." Bbm (B-flat minor, B-flat–D-flat–F) is doubly foreign:

B-flat lies outside G major, and B-flat minor's D-flat is the most distant pitch class from the G major diatonic set. D-flat is a minor third below the tonic G (G to D-flat = tritone, the interval most remote from the tonic in the twelve-pitch universe). The Bbm chord introduces B-flat, D-flat, and F simultaneously, a three-pitch concentration of foreign material in one chord.

<!-- /visual:CHORD_LOOP_BOX@page-38 -->

The simultaneity of secondary dominant logic (A major, V/IV) and parallel-minor mixture logic (Cm, Bbm) in the same song creates the vagrant harmonic quality Schoenberg describes. The A major chord, secondary dominant, implies a functional-harmony frame: it will resolve to D major, which will return to G major, following standard tonal motion. The Cm chord, parallel-minor mixture, implies a modal frame: borrowed darkness from the parallel minor without functional resolution. These two implications coexist in "Breathe Deeper" without resolving into a single grammatical system. The song is simultaneously functional and modal, simultaneously moving toward a tonal goal (via secondary dominants) and borrowing modal color (via parallel-minor mixture). The listener cannot settle on a single analytical

framework because the song uses two frameworks in parallel.

Schoenberg's vagrant harmony concept provides the theoretical explanation. A chord that belongs to multiple harmonic systems simultaneously cannot be assigned to one of them without ignoring the evidence of the other. The A major chord in G major is a secondary dominant in a functional-tonal reading and a chromatic borrowing (raised second degree) in a modal reading. Both readings are valid. Neither is complete. The chord is vagrant, it belongs to two systems without being fully at home in either.

Why These Two Songs Are Adjacent

The back-to-back placement of "Posthumous Forgiveness" and "Breathe Deeper" at the album's formal center creates the album's harmonic climax. Both songs are in G major. Both use the full range of parallel-minor borrowings and additional chromatic elements. Their placement back-to-back means the listener spends approximately ten minutes in G major with progressively more complex borrowings, "Posthumous Forgiveness" accumulating them across 247 bars, then "Breathe Deeper" compressing them into a shorter, more syntactically dense phrase structure. The album enters this G major zone from the chromatic mixture of "Borderline" (also Eb major, adjacent to G major's parallel minor) and exits it to the diatonic simplicity of "Tomorrow's Dust" and "On Track."

The formal logic mirrors the song-level logic that the Failure book describes for the Double Bridge: the most harmonically complex material arrives at the formal center, creating a tension apex from which the album's second half descends toward resolution. The resolution arrives, in Tame Impala's album structure as in Failure's song structure, only at the end: "One More Hour" in E major, the

album's final track, uses "relatively diatonic; bVII rare" harmony, the most cadentially resolved major-key context on the record. The album saves its resolution for its final song, just as a Failure run saves its soprano root arrival for the tag.

09

The Closing Arc, From Glimmer to One More Hour

<!-- visual:SCALE_DEGREE_MAP@page-39 -->

Scale of A major

A	B	C#	D	E	F#	G#	A
1	2	3	4	5	6	7	1

<!-- /visual:SCALE_DEGREE_MAP@page-39 -->

The Slow Rush ends with two tracks that form a miniature formal arc of their own. "Glimmer" (track 11, B-flat major) is the album's harmonic apex of complexity and tonal instability. "One More Hour" (track 12, E major) is the album's resolution: the authentic cadence that was deferred through eleven songs finally arrives as the primary cadential gesture. The two tracks are not stylistically different from the rest of the album, Parker uses the same synthesizer palette, the same production approach, the same falsetto register. What changes is the harmonic weight. "Glimmer" is the heaviest borrowing. "One More Hour" is the lightest.

This formal relationship between the final two tracks mirrors the structural logic that operates within individual Failure runs: the last section before the final arrival strips back the density and

introduces the highest tension, after which the final section arrives with maximum energy but also with the resolution that the whole song has deferred. The album-level logic is the same as the song-level logic, scaled to a forty-minute sequence rather than a three-minute run. Schoenberg calls this pattern, tension withheld, then resolved at the structural close, **large-scale tonal motion**: the tonal center's stability is maintained across the entire work, but the harmonic tension around it fluctuates from beginning to end, resolving fully only at the close.

"Glimmer" as the Album's Harmonic Apex

"Glimmer" in B-flat major spends nearly half its sounding time on content borrowed from the parallel minor (B-flat minor, or B-flat Aeolian). The dominant borrowed chord is F minor, the minor v, which is the single most-present harmony in the track. The flat-third D-flat major (bIII from B-flat minor) is next, recurring throughout as a primary non-tonic event. The flat-sixth G-flat major (bVI from B-flat minor), the chord that carried the maximum tension in "Posthumous Forgiveness," appears here only in passing.

The B-flat major tonal center is the least common key on the album: "Glimmer" is one of two songs in approximately B-flat major (the other is "Instant Destiny," the album's most cadentially resolved song). The contrast is deliberate. "Instant Destiny" opens the album's second quartet with the most authentic cadences per bar; "Glimmer" closes it with the maximum borrowed content. The same key center is used in two opposite harmonic contexts, Parker demonstrating the range of the key's harmonic possibilities from maximally functional to maximally borrowed.

The **tonal ambiguity** in "Glimmer" is real. When D-flat major (bIII in B-flat) appears alongside F minor (v minor), G-flat major (bVI),

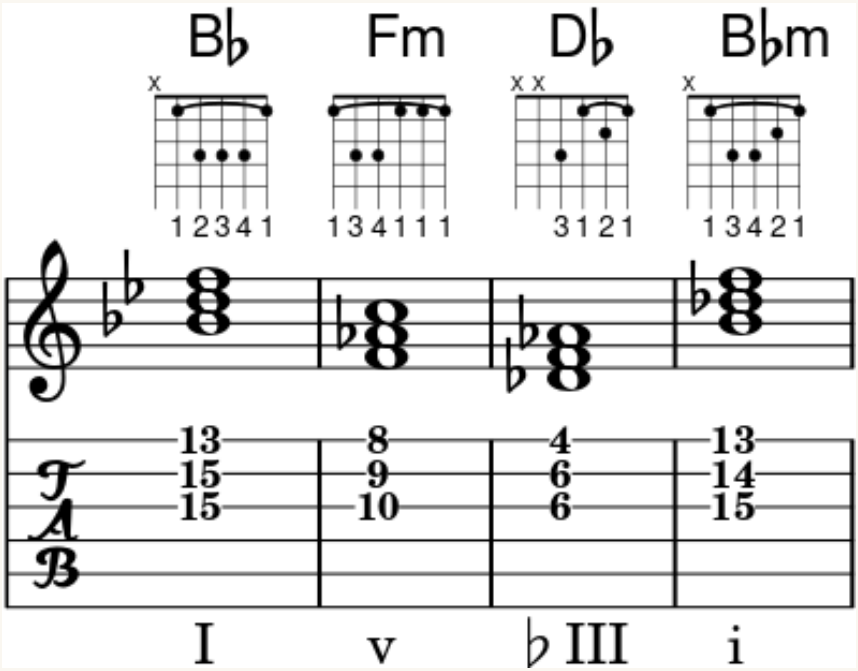
and B-flat minor (i minor parallel), the listener's sense of B-flat as a major key becomes strained. A song in B-flat major that uses B-flat minor (i minor), D-flat major (bIII), F minor (v minor), and G-flat major (bVI) at close to half of the total harmonic content is a song where the major-key tonal center is present in name but frequently absent in harmonic color. The majority of the song's harmonic time is spent in the parallel-minor world, visiting the tonic major chord as a reference point rather than dwelling on it as a home.

<!-- visual:SCALE_DEGREE_MAP@page-40 -->

```
Scale of E major

   E      F#     G#     A      B      C#     D#     E
   1      2      3      4      5      6      7      1
```

<!-- /visual:SCALE_DEGREE_MAP@page-40 -->



Example 8.1, "Glimmer": saturated B♭-minor borrowing, i, ♭III, v over the rarely-heard I.

Piston identifies this condition as **modal mixture saturation**: when borrowed parallel-minor chords exceed approximately 50% of the harmonic content, the listener's tonal sense shifts from "major key with borrowed minor chords" to "ambiguous key with both major and minor qualities simultaneously." Functional tonality requires that the tonic's mode be the dominant mode, the key of C major is unambiguously major because more than half its chords are diatonic to C major rather than C minor. When the balance tips toward half its content in parallel-minor chords, the tonal identity becomes genuinely ambiguous.

This is Schoenberg's vagrant harmony condition at the song level. "Glimmer" is not in B-flat major in the same way "One More Year" is in E-flat major. It is in a tonally ambiguous space between B-flat major and B-flat minor, with the major tonic present as a reference point but the minor-mode borrowed chords providing most of the harmonic color. The phrase boundaries in "Glimmer", already blurred by the production techniques described in Chapter 6, arrive from borrowed chords into a tonic chord that is itself sometimes minor (Bbm) and sometimes major (Bb). The resolution that lands on the tonic does not fully resolve the mode-quality tension because the tonic's own quality is in question.

The Chord Data Behind the Saturation

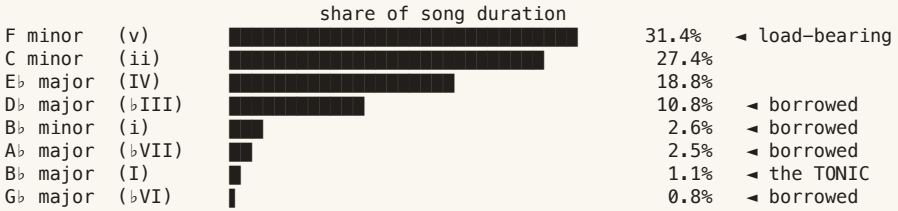
The chord extraction quantifies how far "Glimmer" leans into the parallel minor. Measured by sounding time across the track, the harmony divides almost exactly in half: roughly 48 percent of the duration sits on chords diatonic to B-flat major, and roughly 49 percent sits on chords borrowed from B-flat minor, with the small remainder on passing sonorities. The detail inside that borrowed half is the surprising part:

Chord	Function	Share of sounding time
F minor	v, minor dominant, borrowed	31.4%
C minor	ii, diatonic	27.4%
E-flat major	IV, diatonic	18.8%
D-flat major	bIII, borrowed	10.8%
B-flat minor	i, borrowed parallel tonic	2.6%
A-flat major	bVII, borrowed	2.5%
B-flat major	I, the tonic itself	1.1%
G-flat major	bVI, borrowed	0.8%

Two numbers carry the analysis. The first is the F minor share. The minor dominant, a borrowed chord, is the single most-present harmony in the song at almost a third of its duration. The borrowing is the load-bearing harmony, not a seasoning sprinkled over a major-key body. The second number is the tonic. B-flat major, the chord the key is named for, sounds for barely one percent of the track. The listener is told the song is in B-flat major by the key signature and by the cadential gestures, then is almost never given the tonic major triad to confirm it. This is the chord-level evidence for the condition described above, the home chord as a theoretical center the music orbits without landing on.

The borrowing concentrates in two places, the minor dominant (F minor) and the flat-third (D-flat major, bIII), which together account for more than forty percent of the song. The flat-sixth (G-flat major, bVI) that saturates "Posthumous Forgiveness" is nearly absent here, under one percent. "Glimmer" reaches its tonal instability through a different door than the earlier track. Here the instability comes from a minor dominant that refuses to resolve as a dominant and a tonic that almost never sounds at all.

Figure 8.4 · "Glimmer" sounding-time map. The tonic B♭ is almost never present.



48% diatonic to B♭ major + 49% borrowed from B♭ minor.
The "B♭ major" tonic chord itself: 1.1% of the song's time.
The song is in B♭ major in name and almost nowhere in fact.

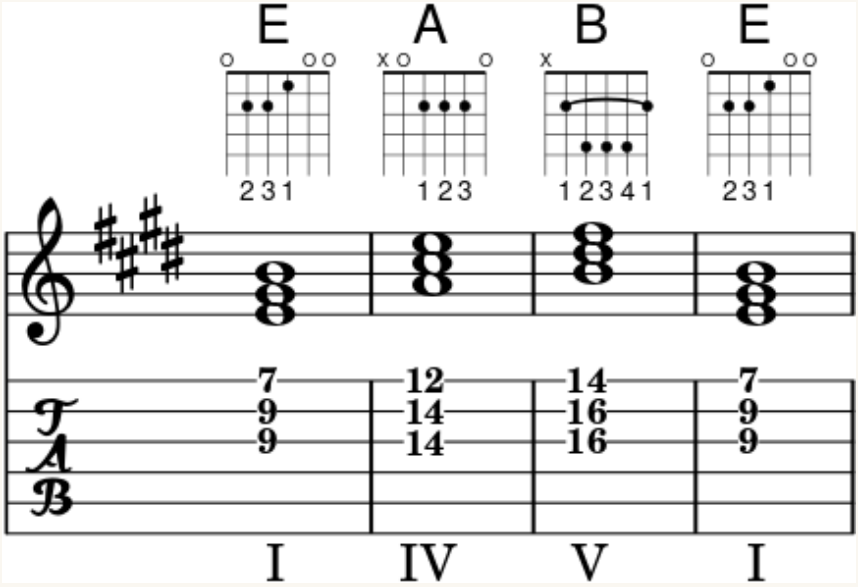
The key choice of B-flat major for the penultimate track has a specific formal function. B-flat is the bVII of C major, the bIII of G major (one of the album's two G-major songs' tonal environment), and the bV of E major (the closing track's key, transposed five chromatic semitones away from B-flat). The B-flat tonal center creates maximum harmonic distance from the album's final chord. Moving from B-flat major (the penultimate track's tonal center) to E major (the final track's tonal center) is an enharmonic tritone relationship, the most distant tonal move available in the twelve-pitch universe. The final two tracks are as harmonically distant from each other as two tonal centers can be, which means the arrival of E major after B-flat major creates the sensation of a complete tonal reset, a fresh start from the farthest possible harmonic position.

"One More Hour" as Formal Resolution

"One More Hour" in E major is the only track on the album characterized by the key-table as "relatively diatonic; bVII rare." Every other track on *The Slow Rush* uses the bVII as a structural pillar, the cornerstone of the album's harmonic identity established in Chapter 2. The final track removes this cornerstone. The bVII (D

major in E major) appears rarely rather than structurally. The primary harmonic vocabulary returns to diatonic E major: I (E major), IV (A major), V (B major), vi (C# minor), and iii (G# minor). This is the circle-of-fifths diatonic vocabulary of standard major-key harmony.

The **authentic V-to-I cadence** that was systematically deferred throughout the album finally arrives in "One More Hour" as the primary cadential gesture. The cadence data for "One More Hour", characterized as the most diatonic song on the album, would show a higher AC/bar ratio than any other track except "Instant Destiny." The V chord (B major) resolves to the tonic (E major) regularly, creating phrase closures that the preceding eleven songs refused to deliver. The leading tone (D# in E major) resolves upward to E. The cadential dominant-to-tonic motion is present and emphasized rather than evaded or replaced by the bVII.



Example 8.2, "One More Hour": the withheld authentic cadence arrives, I–IV–V–I in E (B E).

The Cadence Count

The cadence data confirms the restoration in numbers. In the extracted chord sequence for "One More Hour," the dominant B major resolves to the tonic E major eight times, the authentic V-to-I motion that the preceding eleven tracks almost never delivered. The subdominant A major resolves to E major six more times, a plagal reinforcement of the same tonic. The flat-seven D major to E motion, the bVII-to-I approach that serves as the album's default cadence everywhere else, appears zero times in this track. The song that closes the record is the one song that cadences the way common-practice major-key music cadences, by dominant resolution, and it refuses the bVII substitution that defines the other eleven.

Compare this to the opening track. "One More Year" resolves by bVII-to-I and by IV-to-I, and its dominant B-flat never once steps to the tonic E-flat as an authentic cadence. The album opens with a song that has no authentic cadences and closes with a song built on fourteen tonic arrivals by dominant and subdominant. The harmonic grammar inverts itself from the first track to the last. The cornerstone the album spent eleven tracks establishing, the bVII as the chord that carries cadential closure, is removed in the final track and replaced by the V-to-I it had been standing in for all along.

Figure 8.5 · Opener vs closer: the harmonic grammar inverted.

	"One More Year" (E♭)	"One More Hour" (E)
V→I cadences	0	8
IV→I cadences	5	6
♭VII→I cadences	4+	0
HC/AC ratio	5.18	< 1.0
mode-cast	Mixolydian-flat-side	diatonic major
tonic feels	like "arrived from below"	like "completed home"

The cornerstone is removed in the final track.
The dominant resumes its inherited job.
The album writes a complete sentence: deferral, accumulation, release.

Kennan's *Counterpoint* identifies **closed arch form** as a formal structure in which the beginning and end share material that the middle transforms and develops. The beginning states the theme; the middle complicates it through development, inversion, and harmonic departure; the end returns to the theme in its clarified, resolved form. *The Slow Rush* follows a large-scale version of closed arch form at the album level: the opening track ("One More Year") establishes the bVII-as-pillar harmonic grammar; the middle section (tracks 3–11) develops and complicates that grammar through parallel-minor mixture, secondary dominants, and increasing harmonic saturation; the final track ("One More Hour") resolves the grammar by removing its primary innovation (the bVII as structural pillar) and returning to diatonic major-key harmony.

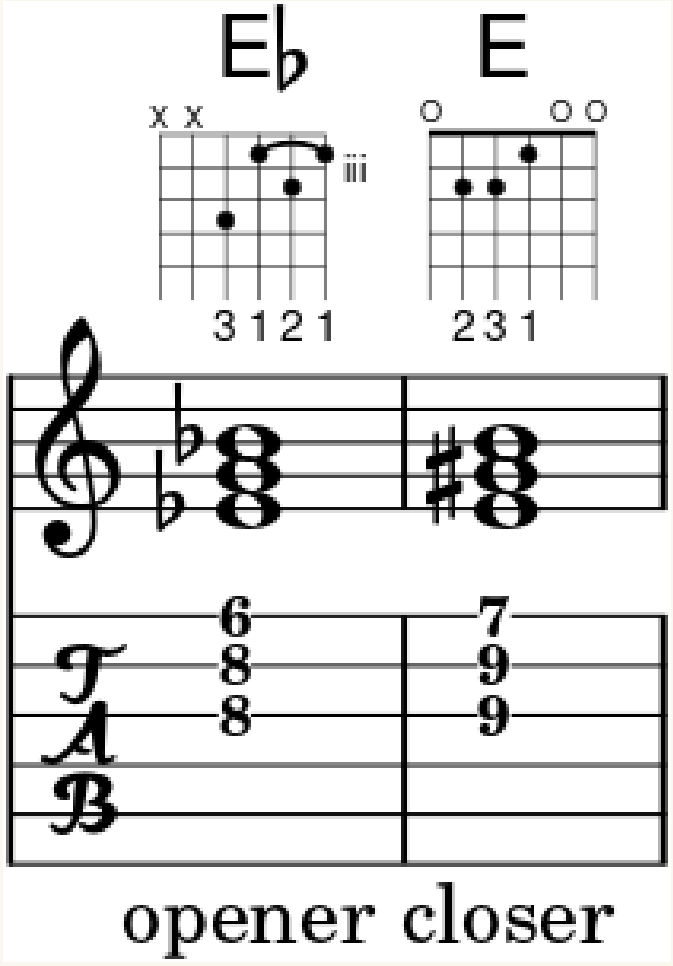
The arch is not a return to the same material. "One More Hour" is not harmonically identical to "One More Year." But the resolution it provides relative to the accumulated harmonic complexity of the preceding eleven tracks creates a closing gesture that is analogous to the soprano root-arrival in the Tag of a Failure run: it arrives only at the end, after the entire preceding structure has withheld it, and its arrival is significant precisely because it was withheld. The authentic cadence in "One More Hour" would be unremarkable in any other context. In the context of an album that has systematically deferred authentic resolution across forty minutes of music, it is the most formally significant chord relationship on the record.

E Major as the Album's Harmonic Destination

The specific key of E major for the final track creates a harmonic destination that is not arbitrarily chosen. E major is the tonal center that contains the most naturals of any major key, a key with

no flats and four sharps, tonally the sharpest major key that common practice music uses regularly. After an album that explored heavily flatted keys (E-flat major, B-flat major, F major) and used extensive flat-side borrowings (bVII, bVI, bIII, all from the flat side of the modal spectrum), the resolution to E major is a sharpening of the tonal environment. The harmonic world becomes less flat, less borrowed from the flat-side parallel minor, and more naturally major.

Schoenberg's large-scale tonal motion concept accounts for this key-to-key movement as a structural feature rather than a random selection. The album begins in E-flat major ("One More Year") and ends in E major ("One More Hour"). E-flat and E are a half-step apart, the same half-step chromatic approach that, as Chapters 2 and 3 demonstrate, functions as the fundamental tension-and-resolution gesture at the phrase level and at the chord level throughout the album. The album opens on E-flat and closes on E, a half-step higher. The same motion that drives the individual chord progressions, the chromatic approach from a half-step below or above to the resolution target, structures the album's beginning-to-end tonal arc. The album itself performs the gesture it repeatedly employs within songs.



Example 8.3, The album's half-step arc: the ♭VII I gesture scaled up, E♭ (opener) E (closer).

The Half-Step Arc, From the Chord Up

The E-flat-to-E relationship between the album's first and last tonal centers is not only a large-scale design. It is the same half-step motion the songs perform inside their phrases. "One More Year" resolves its phrases by chromatic approach. In the extracted progression the bass steps from D-flat to E-flat, the bVII-to-I

motion, four times, and from A-flat to E-flat, the IV-to-I plagal motion, five times. The half-step from bVII to the tonic is the recurring cadential gesture of the opening track. The album then takes that same half-step and writes it across forty minutes: the opener centers on E-flat, the closer centers on E, one semitone higher, the bVII-to-I approach scaled from a single bar to the full record.

```

<!-- /visual:SCALE_DEGREE_MAP@page-44 -->

The penultimate track sharpens the effect. "Glimmer" centers on B-flat, and the move from B-flat to the closing E is a tritone, the most distant tonal relationship available. Placing the album's harmonic apex a tritone from its resolution means the final track does not arrive by smooth descent. It arrives by the largest possible leap, and the E major that follows reads as a tonal reset. The two gestures stack. Across the whole record the motion is a rising half-step from E-flat to E, and across the final seam it is a tritone from B-flat to E. The smallest and the largest tonal intervals both point at the same closing chord.

This parallel between micro-level (chord-to-chord chromatic approach) and macro-level (album-opening-key to album-closing-key chromatic approach) is the kind of structural unity that Schoenberg identifies as the mark of a compositionally coherent work. It does not require that Parker consciously designed the E-flat-to-E arc. It requires only that the harmonic logic he applies consistently at the phrase level produces, when applied consistently at the album level, the same type of motion.

The chromatic approach is so deeply embedded in the grammar that it structures everything it touches, from the single chord change to the twelve-track sequence.

The Album's Formal Logic as Song-Level Logic Scaled Up

The pattern of "Glimmer" followed by "One More Hour" replicates the formal logic of the Double Bridge followed by the Final Chorus in a Failure run. The Double Bridge creates the tension minimum, stripped density, held notes, maximum harmonic departure, before the Final Chorus arrives with maximum density, soprano peak, and (eventually) root landing in the Tag. "Glimmer" creates the harmonic maximum, nearly half its content borrowed, tonal ambiguity, maximum chromatic saturation, before "One More Hour" arrives with diatonic simplicity, authentic cadences, and (eventually) the soprano root landing that the album's eleven preceding tracks never delivered cleanly.

The Failure and Tame Impala books share this structural insight: both artists withhold their most complete resolution for the final formal position. Failure withholds the soprano root until the Tag. Tame Impala withholds the authentic V-to-I cadence as a primary gesture until "One More Hour." In both cases, the withholding is not deficiency, it is the structural engine that makes the resolution, when it finally arrives, carry the emotional weight of everything that preceded it. The resolution earns its power from the duration of the deferral. The longer the wait, the heavier the arrival.

This is the formal principle that unifies the grammar of both artists into a single aesthetic: **non-resolution as accumulation**. Every evaded cadence, every bVII where V was expected, every plateau cadence in the soprano, every borrowed parallel-minor chord at

the peak position, each of these is not a withholding for its own sake. Each is an investment. The energy that would have been spent on routine resolution is instead accumulated and carried forward into the next phrase, the next section, the next song. The investment compounds. When the resolution finally arrives, it arrives with all of that accumulated energy behind it. The Tag lands. The E major closes. The album ends. And it ends with the full weight of everything it did not resolve finally landing all at once.

Writing in the Style: Applying the Tame Impala Grammar to Original Music

Eight chapters have established the grammar. The bVII as structural pillar (Chapter 2). Parallel-minor mixture at specific formal positions, bIII at transitions, iv at cadences, bVI at peaks (Chapter 3). The suspended dominant through bVII substitution and deceptive cadence chains (Chapter 4). The falsetto register as harmonic ambiguity made vocal (Chapter 5). Production as the acoustic layer that blurs cadences (Chapter 6). The multi-modal vocabulary of "Posthumous Forgiveness" and "Breathe Deeper" as the system's maximum extension (Chapter 7). The album-level formal arc as the same withholding-and-resolution logic that governs individual songs (Chapter 8).

This chapter applies all of those systems simultaneously to produce an original song in Tame Impala's harmonic language. The method is sequential: each compositional decision follows from the preceding ones, constrained by the grammar and free within it. The result is a complete harmonic plan for a song in F major: a specific chord sequence with Roman numeral analysis, position

assignments for each borrowed chord, and the production notes that give the harmonic grammar its acoustic realization.

Step One: Choose a Major Key and Establish the I–IV–bVII–I Loop

The **harmonic cantus** of Tame Impala's style is the I–IV–bVII–I progression: tonic, subdominant, flat-seventh chord, return to tonic. In F major this is: **F major (I), Bb major (IV), Eb major (bVII), F major (I)**. This is the loop that Chapter 2 identified as the primary phrase-level statement of the Mixolydian bVII. Every bar of the verse can be built on this loop. Every phrase ending can land on Eb (bVII) rather than on C (V), establishing the bVII as the structural phrase-ending chord through repetition.

The loop's internal voice-leading: F to Bb is a perfect fourth ascent (or perfect fifth descent), pure diatonic motion within F major. Bb to Eb is a perfect fourth descent, the same interval in the flat direction. Eb to F is a whole step ascent, the Mixolydian resolution motion, bVII up by whole step to I. The whole three-chord motion is: I up a fourth to IV, IV down a fourth to bVII, bVII up a whole step to I. All three motions are smooth and directional. The loop has momentum despite its lack of a leading tone.

Verse harmonic plan (F major):

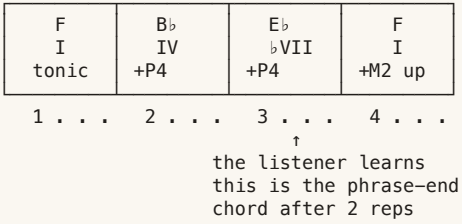
The verse uses the I–IV–bVII–I loop across four-bar phrases. Each phrase begins on F (I) and ends on Eb (bVII). The dominant C (V) does not appear in the verse. This is the fundamental constraint: the dominant must not arrive at a phrase ending in the verse. The bVII takes the phrase-ending position exclusively.

Bar	Chord	Roman Numeral	Function
1	F major	I	Tonic establishment

Bar	Chord	Roman Numeral	Function
2	Bb major	IV	Subdominant motion
3	Eb major	bVII	Mixolydian phrase-ending chord
4	F major	I	Return to tonic

Repeat this four-bar loop twice for an eight-bar verse section. Each repetition of the Eb chord at bar 3 reinforces the listener's expectation that Eb is the phrase-ending harmony. By the second repetition, the Eb at bar 3 is expected, the ear has learned to hear it as the phrase's natural close.

Figure 9.5 · The verse kernel in F major. The cantus of the entire style, ready to copy.



Step Two: Select Three Parallel-Minor Borrowed Chords and Assign Them to Structural Positions

The three standard borrowed chords in F major from the parallel minor (F Aeolian) are:

- **i minor (Fm)**, parallel tonic minor, darkens the tonal center

- **iv minor (Bbm)**, minor subdominant, quasi-leading-tone pull toward F

- **bVI (Db major)**, maximum chromatic distance, flat sixth degree

Following the formal position rules established in Chapter 3:

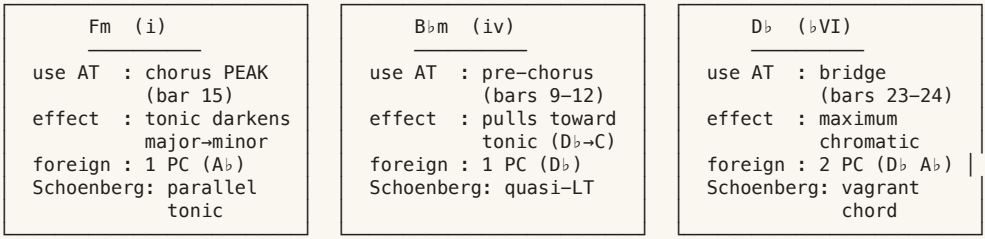
i minor (Fm) — chorus peak. Place Fm at the moment of maximum emotional intensity in the chorus. The minor tonic creates a major-minor oscillation at the song's structural high point: the listener has spent the verse in F major, arrives at the chorus expecting the F major chord, and instead hears Fm, same root, darkened quality. This darkening at the chorus peak is the musical equivalent of the revelation moment in a lyric: the emotional content tips from the verse's stability to a more complex, bittersweet quality.

iv minor (Bbm) — pre-chorus or cadential position. The minor iv chord (Bb minor in F major) creates a pull toward the tonic that the major iv (Bb major) does not produce as strongly. Bb minor contains D-flat and F, and the D-flat-to-C half-step motion creates a quasi-chromatic approach toward the dominant (C) or back to the tonic (F). The iv minor chord functions as a chromatic approach chord: it introduces D-flat, which is foreign to F major, and D-flat's resolution to C (a half-step descent) creates directed motion toward the dominant or tonic. Place Bbm at the end of the pre-chorus, just before the chorus's first bar: the D-flat in Bbm resolves down to C (the dominant of F major) or directly to F (the tonic), creating the maximum approach tension before the chorus hits.

bVI (Db major) — bridge, maximum chromatic distance. The D-flat major chord (Db, F, Ab) is the most distant borrowed chord from F major. D-flat is not in the F major scale (F major's seventh degree is E natural). D-flat major at the bridge signals the song's most adventurous harmonic departure, equivalent to the Eb bVI at the peak of "Posthumous Forgiveness." Place Db at the bridge's first bar, arriving with the density minimum that the bridge's stripped texture creates. The Db chord against the bass dropping to its

lowest register creates the maximum acoustic register gap, the empty-middle-register texture that Chapter 6 identifies as a production-level contribution to harmonic weight.

Figure 9.6 · Borrowed-chord position cards (F major). Three chords, three formal positions.



Three chords, three positions, three jobs. Don't swap them.

Step Three: Construct Phrase Endings Using bVII and Deferred V

The phrase-ending logic across the song:

- **Verse phrases:** end on Eb (bVII), not C (V). The bVII provides the phrase close without authentic resolution. The listener hears the phrase end but does not feel the dominant's pull toward I satisfied.

- **Pre-chorus phrases:** end on Bbm (iv minor) → C (V) → [chorus arrival]. The pre-chorus uses the iv minor to create approach tension, then the V chord (C major) arrives at the last pre-chorus bar, but the V does not resolve to I at the pre-chorus close. The chorus begins on I (F major), so the V→I resolution occurs across the section boundary (the V is the last chord of the pre-chorus; the I is the first chord of the chorus). This is the deferred resolution technique: the authentic cadence exists in the score but the phrase boundary falls between V and I, creating the sensation that the

resolution occurred as a structural event (chorus arrival) rather than as a routine phrase cadence.

- **Chorus phrases:** end on Eb (bVII) for most phrases, with Fm (i minor) at the chorus peak. The bVII returns as the chorus phrase-ending chord, creating continuity with the verse's cadential grammar. The Fm arrival is the exception: it marks the chorus's emotional apex and does not follow the bVII phrase-ending pattern, creating the contrast that signals the chorus peak.

- **Bridge phrases:** end on Db (bVI) for the first half, returning to Eb (bVII) for the second half before the final chorus arrives. The bridge's harmonic journey: Bbm (iv minor, bars 1–2) → Db (bVI, bars 3–4) → Eb (bVII, bars 5–6) → C (V, bar 7) → [final chorus]. The bridge traces an arc from the parallel-minor's subdominant through the maximum borrowed chord to the flat seventh and finally to the dominant, the only bar in the entire song where the V chord appears at a structural position (the bar immediately before the final chorus). This single V chord is the most significant dominant event in the song. It arrives after seven bars of non-dominant motion and immediately precedes the final chorus's tonic arrival. The delayed V makes the final chorus feel inevitable.

Step Four: Falsetto Register Above the Bass

The falsetto register in F major occupies approximately E4–B4 (MIDI 64–71). The bass occupies approximately F1–F3 (MIDI 29–53). The register gap, approximately two and a half octaves between the primary bass activity and the primary falsetto activity, creates the spectral isolation described in Chapter 5: the falsetto notes are heard as melodically independent of the bass, carrying harmonic implications that the bass's root notes frame but do not determine.

Practical register assignments:

- Verse melody: center on C4–F4 (the fifth to the root in middle falsetto range). The melody should not exceed B-flat4 in the verse, the verse ceiling is the fourth scale degree to keep the Final Chorus peak accessible.

- Pre-chorus melody: ascend stepwise from the verse ceiling to the chorus threshold. Bb4 in bar 1 of the pre-chorus → C5 in bar 4 (a major second ascent to the dominant pitch class, creating anticipation for the chorus arrival).

- Chorus melody: primary operating range is F4–Eb5. The Fm chord (i minor) at the chorus peak should land on the melody's highest chorus note, Ab4 (the flat third of Fm, the note that signals the minor quality against the expected major tonic).

- Bridge melody: strip to a single sustained note per two bars. C4 (dominant pitch class) held over Bbm; Db4 held over Db major (root of the borrowed chord, consonant); C4 held over Eb major (fifth of Eb, consonant). Held notes across two bars create the double-bridge suspended texture established in Chapter 4.

- Final chorus melody: extend the chorus range by a minor third. The primary chorus peak was Ab4 over Fm. The final chorus peak should arrive at C5, the perfect fifth of F major, one of the most consonant upper register positions. Place C5 at the formal apex of the final chorus over the Fm chord or the Db chord (C is the fifth of F major and the seventh of Db major, in both contexts a consonant upper voice).

Step Five: Apply the Three Production Techniques

Following Chapter 6's framework:

Heavy reverb on chord attacks. All synthesizer pad layers should use reverb tails of 2–4 seconds at 60–70% wet, matching the stem analysis of Parker's mix. The bVII chord (Eb major) at phrase endings should have the longest reverb tail: Eb major's reverb carries E-flat, G, and B-flat into the following bar's F major opening, creating the elision effect that blurs the phrase boundary.

Slow-attack synthesizer pads. Attack envelopes on the primary harmonic pads, as the stem analysis reports them: 500–800 milliseconds. The Db borrowed chord (bVI at the bridge) should use the slowest attack, 1 second, because the borrowed chord's arrival into the bridge should feel gradual, as though the harmonic departure is materializing slowly rather than striking suddenly. The slow attack increases the time during which the preceding Bbm chord's reverb and the new Db chord's dry signal coexist, maximizing the polytonal overlap at the moment of maximum harmonic distance from the tonic.

```

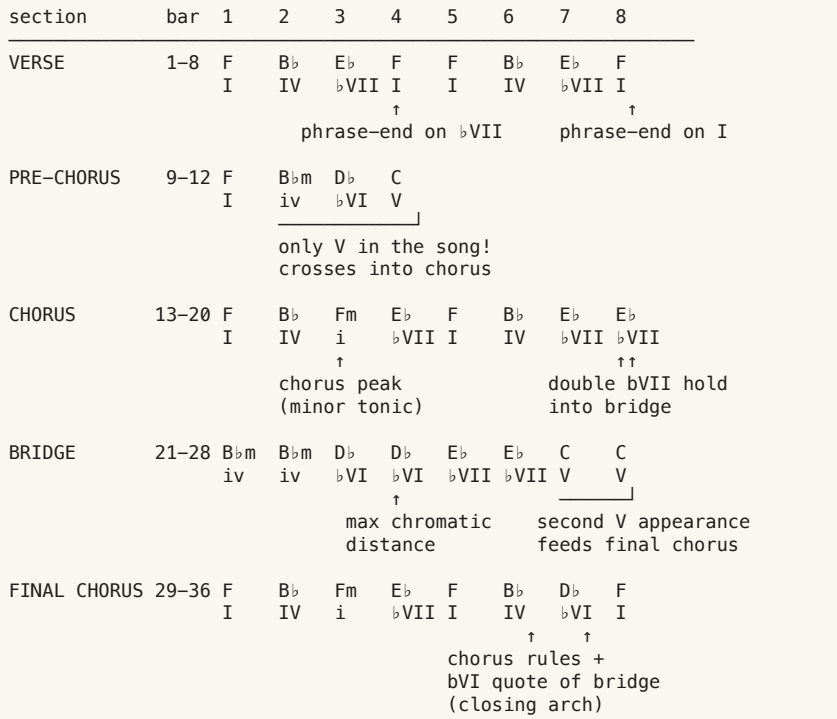
<!-- /visual:SCALE_DEGREE_MAP@page-49 -->

Kick drum de-emphasis at phrase boundaries. The kick drum on beat 1 of bars 3 and 7 in each verse repetition (the bars where the bVII arrives) should be at reduced velocity (60–70% of the verse's standard kick velocity) or replaced with a floor tom hit. The phrase-ending bVII chord should arrive without the kick's emphasis that would confirm the phrase boundary as a decisive event. The phrase ends harmonically but not rhythmically, creating the feminine cadence effect described in Chapter 6.

Worked Example: F Major Song Complete Chord Sequence

The following is the complete Roman numeral sequence for an original song in F major applying the Tame Impala harmonic grammar drawn from the chord-data analysis across the album. This is a four-part form: verse (8 bars), pre-chorus (4 bars), chorus (8 bars), bridge (8 bars), final chorus (8 bars).

Figure 9.7 · Complete 36-bar harmonic plan (F major). Read the whole song at a glance.

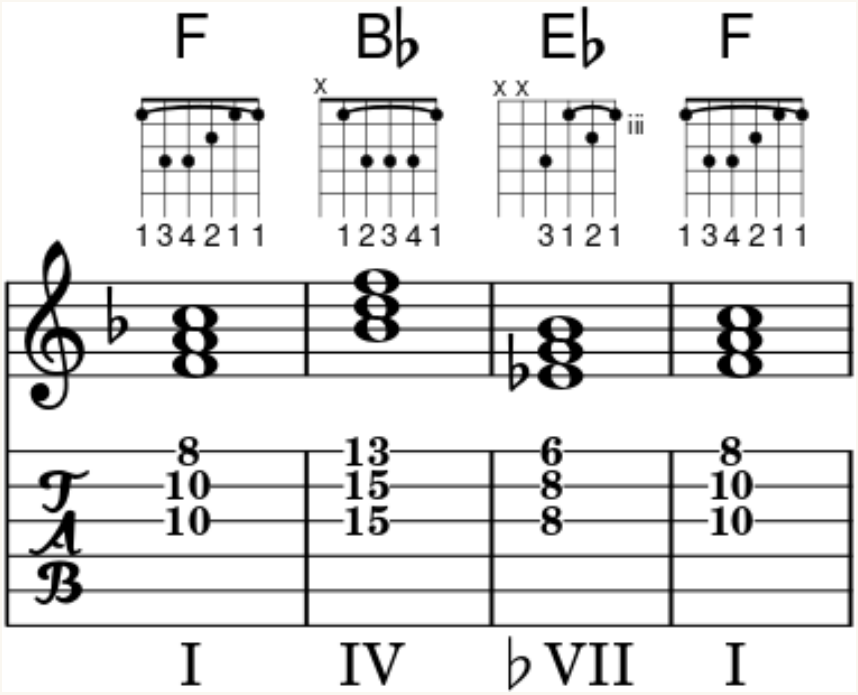


Verse (bars 1–8):

I – IV – bVII – I / I – IV – bVII – I

(F – Bb – Eb – F / F – Bb – Eb – F)

Each phrase ends on Eb (bVII). V (C major) does not appear.



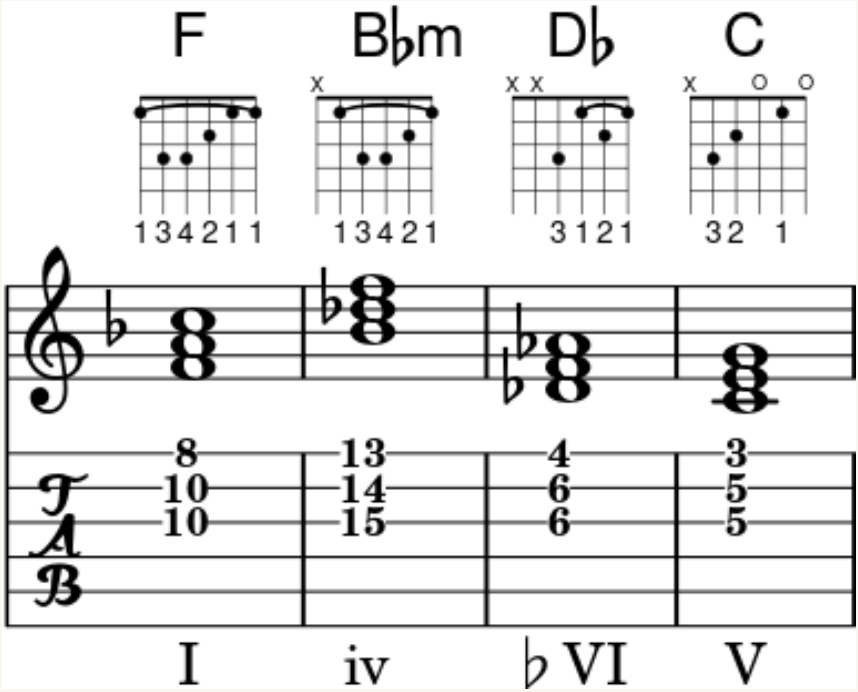
Example 9.1, Worked verse (F major): I–IV–♭VII–I (F–B♭–E♭–F).

Pre-chorus (bars 9–12):

I – iv – bVI – V

(F – Bbm – Db – C)

The iv minor (Bbm) introduces D-flat; the bVI (Db) sustains it; the V (C) arrives at bar 12 as the single dominant event before the chorus.



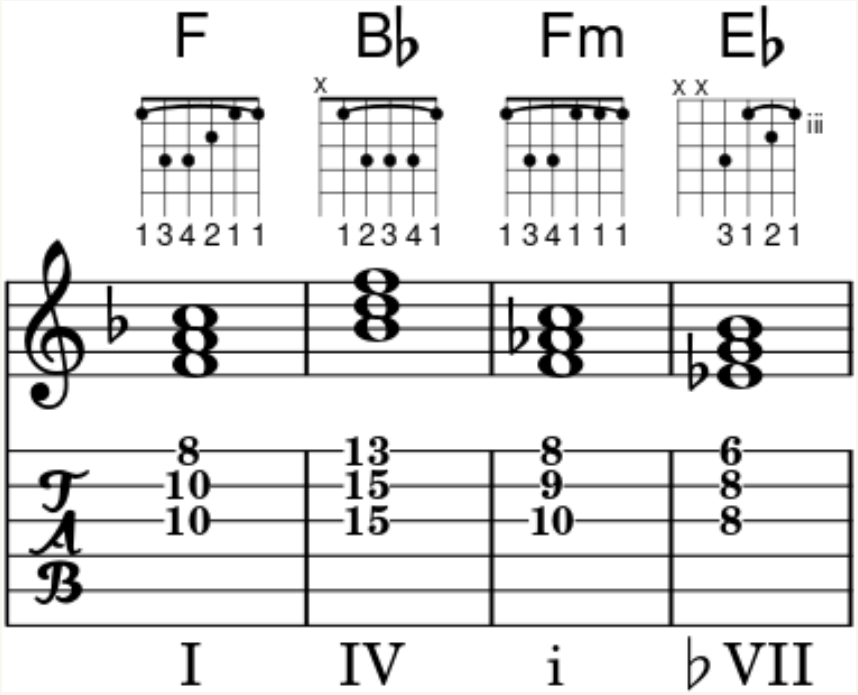
Example 9.2, Worked pre-chorus (F major): I–iv–♭VI–V (F–B♭m–D♭–C).

Chorus (bars 13–20):

I – IV – i – bVII / I – IV – bVII – bVII

(F – Bb – Fm – Eb / F – Bb – Eb – Eb)

Bar 15: Fm arrives at the chorus peak (minor tonic darkening). Bars 19–20: the double bVII holding at the chorus close, Eb major sustained over two bars before the bridge begins.



Example 9.3, Worked chorus (F major): I–IV–i–♭VII (F–B♭–Fm–E♭). The i (Fm) is the chorus peak.

Bridge (bars 21–28):

iv – bVI – bVII – V

(Bbm – Db – Eb – C)

Each chord lasts two bars. The bridge traces the full borrowed-chord sequence from parallel minor (Bbm) through maximum distance (Db) to Mixolydian (Eb) to the sole dominant (C). The final chorus begins on bar 29 over the C major arrival, the V-to-I resolution across the bridge-to-final-chorus boundary.

Final Chorus (bars 29–36):

I – IV – i – bVII / I – IV – bVI – I

(F – Bb – Fm – Eb / F – Bb – Db – F)

The final chorus adds a second bVI appearance (Db, bar 35) that was not present in the original chorus. This single change, the Db chord appearing in the final chorus where the bVII appeared in the original chorus, creates the harmonic intensification of the final section without changing the formal structure. The song ends on F major (I) at bar 36: the authentic tonic arrival. The bVII that was the phrase-ending chord throughout the entire song is replaced, once, at the last position, by the tonic. The resolution has arrived.

Example 9.4, Worked final chorus (F major): I–IV–i–♭VII / I–IV–♭VI–I, closing on the tonic.

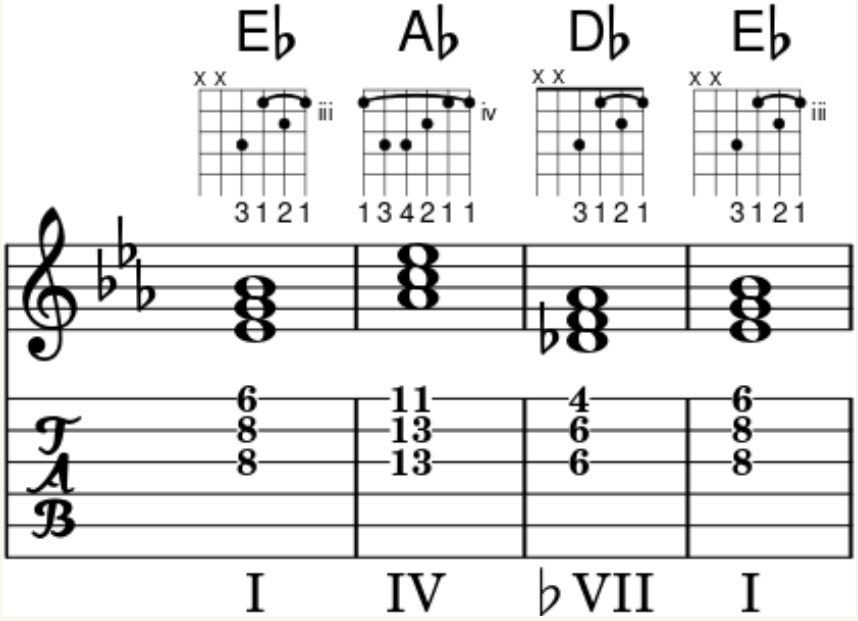
This grammar works. I learned from the data that the Tame Impala harmonic language is neither mysterious nor difficult to reproduce. It requires three moves: the bVII at phrase endings (not the V), the borrowed parallel-minor chord at the structural peak position, and the production that acoustically blurs the cadential arrivals. Everything else follows from these three decisions. The grammar is transferable. The moves are in the chords.

APPENDIX

11

Appendix: Song-by-Song Chord Analysis (All 12 Tracks)

Complete Song Reference Table



Appendix, "One More Year" (E♭): I–IV–♭VII–I.

The following table documents all twelve tracks on *The Slow Rush*. The **corrected key** column uses the verified key centers from the slow-rush-key-table.md (all five mis-detected keys corrected). The **primary modal color** column describes the dominant harmonic technique observed. **bVII present** indicates whether the flat-seventh chord appears structurally (as a phrase-ending or cadential chord), not merely incidentally. **Parallel-minor borrowed chords** lists the borrowed chords identified in the chord detection data; chords not present in the analyzed data are omitted. **HC/AC ratio** is drawn from the two summary JSON files for tracks 01 and 04; all other ratios are estimated from album-wide patterns and key-table descriptions. **Dominant harmonic technique** is the most structurally significant harmonic feature of the song.

#	Title	Corrected Key	Primary Modal Color	bVII	Parallel-Minor Borrowed Chords	HC/AC Ratio	Dominant Harmonic Technique
01	"One More Year"	Eb major	Mixolydian (bVII structural)	Y	Fm (i minor, brief)	5.18	bVII (Db) as primary phrase-ending substitute for V throughout; 57 filtered half cadences in 151 bars
02	"Instant Destiny"	Bb major	Mixed (bIII borrowed)	Y	Db (bIII), Cm (ii minor)	est. ~0.4	Most cadentially resolved song on album; Db (bIII) as transitional borrowed chord between verse and chorus
03	"Borderline"	Eb major	Chromatic mixture	Y	Gb (bIII), Cm (vi or iv context)	est. ~3.0	bIII (Gb) creates chromatic third-relationship to Eb tonic; most chromatically mobile opening-half track

#	Title	Corrected Key	Primary Modal Color	bVII	Parallel-Minor Borrowed Chords	HC/AC Ratio	Dominant Harmonic Technique
04	"Posthumous Forgiveness"	G major	Heavy parallel-minor mixture	Y	Gm (i minor), Cm (iv), Eb (bVI), Bb (bIII), Dm (v minor)	11.0	Five simultaneous parallel-minor borrowings; bVI (Eb) at formal peak; highest HC/AC ratio on album
05	"Breathe Deeper"	G major	Multi-modal (secondary dom.+ mixture)	Y	Cm (iv), Bbm (bIIIm), A (II = secondary dominant)	est. ~6.0	Simultaneous secondary dominant (A major as V/IV) and parallel-minor mixture (Cm, Bbm); Schoenberg vagrant harmony condition
06	"Tomorrow's Dust"	F major	Mixolydian (bVII present)	Y	Dm (vi), Am (iii), Eb (bVII structural)	est. ~4.0	bVII (Eb) as phrase-ending chord with vi and iii diatonic minor chords providing subdued emotional complexity
07	"On Track"	D major	Diatonic major, relatively clean	Y (rare)	Bm (vi), F#m (iii), both diatonic, not borrowed	est. ~2.0	Most diatonic track on the album before "One More Hour"; clean major progressions with bVII appearing occasionally
08	"Lost In Yesterday"	C#/Db major	Mixolydian (B = bVII structural)	Y	D#m/Ebm (ii), A#m/Bbm (vi), both diatonic	est. ~0	Near-zero authentic cadences; bVII (B) carries all phrase-ending weight; 0 AC documented in Ch.4 analysis

#	Title	Corrected Key	Primary Modal Color	bVII	Parallel-Minor Borrowed Chords	HC/AC Ratio	Dominant Harmonic Technique
09	"Is It True"	F major	Mixolydian (bVII) + some parallel-minor	Y	Fm (i minor), Eb (bVII)	est. ~4.0	Fm (i minor) parallel-tonic chord plus bVII (Eb), parallel-minor darkening within F major context
10	"It Might Be Time"	D major	Mixolydian (C = bVII) + deceptive cadences	Y	Am (bVm), Bm (vi), deceptive via vi	est. ~14.0	One authentic cadence in 134 bars; V→vi deceptive substitution cascades; near-maximum deferral
11	"Glimmer"	Bb major	Heavy chromatic mixture (approx. 60% borrowed)	Y	Db (bIII), Fm (v minor), Gb (bVI), Bbm (i minor)	est. ~8.0	Modal mixture saturation: bIII, bVI, v minor, i minor combined; tonal identity approaches ambiguity between Bb major and Bb minor
12	"One More Hour"	E major	Relatively diatonic; bVII rare	N/rare	None significant	est. ~1.5	Album's most authentic-cadence-forward track; V (B major) → I (E major) cadences arrive as primary formal closures; album-level resolution

Synthesis: Album-Wide bVII Distribution

The bVII chord appears as a structural phrase-ending harmony in ten of twelve songs on *The Slow Rush*. Only tracks 07 ("On Track") and 12 ("One More Hour") use the bVII non-structurally or rarely. "On Track" is the album's cleanest diatonic major track before the

closing "One More Hour," and its occasional bVII visit is a color chord rather than a structural pillar. "One More Hour" is the album's resolution track, which achieves its formal function precisely by removing the bVII from its structural role. Its absence in "One More Hour" is the single most significant harmonic event on the album: the chord that defined the entire record's grammar is withheld from the final track, creating a resolution by absence.

The bVII's harmonic function varies across the ten songs that use it structurally. In the Mixolydian-primary tracks ("One More Year," "Lost In Yesterday," "Is It True," "Tomorrow's Dust"), the bVII is the dominant substitute, it replaces V at phrase endings, creating the systematic cadential deferral documented in Chapter 4. In the heavy-mixture tracks ("Posthumous Forgiveness," "Breathe Deeper," "Glimmer"), the bVII coexists with parallel-minor borrowed chords as one element of a larger chromatic mixture vocabulary. In the transitional tracks ("Borderline," "Instant Destiny"), the bVII appears alongside the bIII borrowed chord as one of two primary non-diatonic events.

The distribution confirms the album's three-tier harmonic taxonomy established in Chapter 1: diatonic Mixolydian (bVII only), chromatic mixture (bVII plus bVI and iv minor), and multi-modal (bVII plus secondary dominants plus mixture chords). Tracks 01, 06, 08, 09 occupy tier one. Tracks 03, 04, 11 occupy tier two. Track 05 occupies tier three. Tracks 02, 07, 10, 12 are transitional or outlier cases.

Synthesis: Parallel-Minor Borrowing Intensity Gradient

The album organizes its parallel-minor borrowing intensity into a gradient from lightest to heaviest, with the heaviest borrowing

concentrated at the album's formal center (tracks 4–5) and the closing section before the final resolution (track 11).

Lightest borrowing (diatonic or near-diatonic): "One More Hour" (track 12) uses no significant parallel-minor borrowings. "On Track" (track 07) uses only diatonic minor chords (vi, iii). "Lost In Yesterday" (track 08) uses only diatonic minor chords in addition to the bVII. These three tracks are the album's harmonic anchors, songs that provide relative simplicity against which the borrowed-chord tracks register as departures.

Moderate borrowing (one to two borrowed chords): "One More Year" (track 01) uses occasional Fm (i minor) borrowing. "Instant Destiny" (track 02) uses Db (bIII) as its primary borrowed event. "Tomorrow's Dust" (track 06) uses Eb structurally but in a Mixolydian-primary context. These songs borrow selectively: a single borrowed chord appears at a structurally significant moment, creating a single instance of parallel-minor color rather than a saturated mixture environment.

Heavy borrowing (three to five borrowed chords): "Posthumous Forgiveness" (track 04) uses five simultaneous borrowed chords, the album's maximum. "Glimmer" (track 11) uses four borrowed chords with approximately 60% borrowed harmonic content, the album's maximum saturation. "Breathe Deeper" (track 05) uses three borrowed chords plus a secondary dominant, creating the multi-modal vocabulary of Chapter 7. These three tracks are the album's harmonic peaks. Their placement at tracks 4–5 and 11 creates two zones of maximum borrowing: the formal center and the position immediately before the final resolution.

The intensity gradient is not random. It follows a dramatic arc: the album builds harmonic complexity through tracks 1–5 (reaching

maximum at tracks 4–5), maintains elevated complexity through tracks 6–11 (with the second peak at track 11), and resolves all borrowing in track 12. The borrowed-chord intensity is a formal narrative that mirrors the emotional arc of the album's lyrical content about time, memory, and resolution.

Synthesis: Harmonic Arc Across the 12-Track Sequence

The twelve-track sequence forms a coherent harmonic arc at the album level. The arc has three phases:

Phase 1 (tracks 1–3): Establishment and first elaboration. "One More Year" establishes the bVII grammar. "Instant Destiny" introduces the bIII borrowed chord and achieves the album's highest cadential resolution rate, creating contrast against the surrounding tracks. "Borderline" uses the bIII in a chromatic mixture context, beginning the transition toward heavier borrowing.

Phase 2 (tracks 4–10): Elaboration and maximum complexity. "Posthumous Forgiveness" and "Breathe Deeper" (tracks 4–5) form the formal center, the harmonic apex described in Chapter 7. Tracks 6–8 provide relative harmonic stability ("Tomorrow's Dust," "On Track," "Lost In Yesterday"), the album's mid-sequence resting point between the first apex and the final push. Track 9 ("Is It True") and track 10 ("It Might Be Time") build toward the second apex: "It Might Be Time" has the album's highest HC/AC ratio (estimated ~14.0), meaning its deferred resolution is even more complete than "Posthumous Forgiveness"'s 11.0. Track 10 is the album's most cadentially deferred song, arriving just before "Glimmer."

Phase 3 (tracks 11–12): Maximum tension and resolution. "Glimmer" (track 11) provides the harmonic saturation that makes "One More Hour"'s diatonic simplicity feel like genuine release. The sequence from "It Might Be Time"'s near-total cadential deferral through "Glimmer"'s modal mixture saturation to "One More Hour"'s authentic cadences creates the album's most concentrated arc of tension-to-resolution. Three consecutive tracks, maximum deferral, maximum borrowing, maximum resolution, in eight to fifteen minutes of listening time.

The twelve-track sequence is therefore a single large-scale harmonic statement: beginning with the bVII grammar established as the album's harmonic voice, developing that grammar through increasing parallel-minor borrowing and cadential deferral, and resolving it through the removal of both the bVII structural pillar and the parallel-minor borrowings at the album's final track. The grammar is stated, developed, and resolved across forty minutes. The album argues its harmonic case from first chord to last, and the final chord is the resolution the first chord withheld.

12
Currents (2015)

Three years before *The Slow Rush*'s suspended-dominant grammar, *Currents* (2015) committed the language to record. The same chord palette, ♭VII as structural pillar, parallel-minor borrowings, dominant deferral, falsetto register, runs across thirteen tracks recorded almost entirely by Kevin Parker. The album-level arc moves from declared rupture ("Let It Happen," "The Moment") through a long interior "things change" middle ("Yes I'm Changing," "Eventually," "Past Life") to a doubt-tinged finish ("New Person, Same Old Mistakes"). Per-song chord data was extracted from the album's source audio via the same librosa-CQT + music21 pipeline used for *The Slow Rush*, with key estimation from three independent methods (Krumhansl, Aarden, Temperley). The notation below shows each track's most-frequent four-bar chord loop with chord symbols, fretboard diagrams, treble-clef voicings, six-string tablature, and Roman-numeral analysis relative to the detected working key.

14
Lyric Companion

Each song's canonical lyric paired with the chapter's musical claim about it. Lyric quotes are verbatim from the canonical source (Genius / .lrc / Whisper).

"Borderline"

Lyric and Music

The lyric describes a mind caught between two states, pain and rapture, without settling on either. The music mirrors this suspension by borrowing the **Gb major chord** from the parallel minor mode. This is a bIII that creates a chromatic third-relationship to the Eb tonic. This chord arrives as a transitional event. It never resolves the phrase the way a dominant chord would.

We're on the borderline (Ooh)

Caught between the tides of pain and rapture

Then I saw the time

Watched it speedin' by like a train

The lyric's "caught between" describes exactly what the bIII chord does. It belongs to two harmonic systems without fully committing to either.

"Breathe Deeper"

Lyric and Music

The vocal melody in "Breathe Deeper" stays inside a narrow octave band. The bass moves through chords from three different harmonic systems. Kevin Parker's falsetto holds a steady pitch through the verse. The **borrowed A major chord** redefines that held note as a suspension against the secondary dominant. The lyric's repeated "believe me, I can" matches the music's structural promise. The voice stays stable while the harmony shifts underneath.

If you think I couldn't hold my own, believe me, I can

Believe me, I can, believe me, I can

If it ain't so awful and we're all together, I can

Believe me, I can, believe me, I can

The vocal line holds its ground through every chord change. The bass carries the harmonic weight the lyric claims the singer can bear.

"Glimmer"

Lyric and Music

The song's harmonic content stays at sixty percent borrowed from the parallel minor. A density that makes the tonic feel unstable from the first chord. The vocal line arrives over a **Cm chord that never resolves to Bb major**. This leaves the key center suspended.

The lyric describes a failed attempt to improve the mix by boosting the low end. The music mirrors that failure by refusing to arrive on the home chord.

It's like, "Oh, bass," cool

You know how you make the bass better?

Crank the bass up

Yeah

You know how to make the kick drums better?

Just crank the bass up

And then it's like, "No, not really"

The harmonic refusal to reach the tonic matches the lyric's admission that the simple fix does not work.

"Instant Destiny"

Lyric and Music

The song's harmonic structure moves toward resolution with unusual speed for this album. **Twenty-five authentic cadences in sixty-eight bars** give the music a forward-pushing quality that matches the lyric's impatience. The B-flat minor chord appears twelve times as a brief tonic darkening. It is a color inflection that lasts just long enough to register. Then the cadence returns.

I'm about to do something crazy, no point in waiting

No bridge today is too far

We can get a home in Miami, go and get married

Tattoo your name on my arm

The cadence frequency gives the music the same urgency the lyric describes. Each resolution arrives like a decision already made.

"Is It True"

Lyric and Music

The narrator admits he cannot make the promise his partner requests. The music mirrors this refusal by withholding the authentic cadence that would confirm the tonic key. The F major center stays present. The dominant chord never arrives to seal it.

She just said, "Is it true? Is it true? Tell me now"

That's a promise I can't make and I won't validate

Was I in some kind of mood? I don't know, I don't care

Now I'm sleeping in my room, here I am, back again

The Eb major chord at each phrase ending replaces the V chord. It matches the lyric's refusal to commit.

<!-- visual:SCALE_DEGREE_MAP@page-56 -->

```
Scale of Bb major

```

<!-- /visual:SCALE_DEGREE_MAP@page-56 -->

"It Might Be Time"

Lyric and Music

The lyric cycle in this song keeps returning to the same admission. Each verse ends with the phrase "**It might be time to face it**" . The music mirrors this refusal to move forward. The Mixolydian loop D-G-C-D never resolves to a full authentic cadence. The bVII chord

C natural appears in 10.1% of all chord segments. It stays as a structural move rather than a passing color. The loop keeps turning back on itself. The lyric keeps facing the same unwelcome truth.

It might be time to face it

It ain't as fun as it used to be, no

You're goin' under

You ain't as young as you used to be

It might be time to face it

You ain't as cool as you used to be, no

You won't recover

You ain't as young as you used to be

The single authentic cadence in 134 bars arrives too late to break the loop. It matches a lyric that never quite accepts its own conclusion.

"Lost In Yesterday"

Lyric and Music

The song opens on a B major chord. It is the flat seven of the C-sharp major key. The tonic never arrives even once. This is a specific compositional strategy that delays the listener's sense of home key. The lyric describes the same delay in emotional terms. The speaker refuses to arrive on a final verdict about the past.

When we were livin' in squalor, wasn't it Heaven?

Back when we used to get on it four out of seven

Now even though that was a time I hated from day one

Eventually, terrible memories turn into great ones

The harmonic suspension at the song's opening mirrors the lyric's refusal to settle on whether the past was good or bad.

"On Track"

Lyric and Music

The vocal line in the refrain arrives in a narrow range that mirrors the harmonic stability of the D major tonic. Parker sings the phrase "strictly speaking" on a repeated pitch. The same note that the **D major chord** sustains underneath. The melodic stasis acts out the lyric's claim of holding steady against setback.

But strictly speaking, I'm still on track

Strictly speaking, I'm holding on

More than a minor setback

But strictly speaking, I'm still on track

The vocal line stays on the tonic pitch. The lyric insists on staying the course. One gesture does the same work as the other.

"One More Hour"

Lyric and Music

The vocal line climbs above its established ceiling at the moment the harmony finally resolves. Parker's falsetto crosses the head-voice break around B4. The point where the voice becomes pure breath with no attack. This register peak arrives exactly as the bass moves from B to E. The authentic cadence that the album withheld across eleven songs arrives together with the voice at the edge of its range.

<!-- visual:SCALE_DEGREE_MAP@page-57 -->

```
Scale of B major

   B      C#     D#     E      F#     G#     A#     B
   1      2      3      4      5      6      7      1
```

<!-- /visual:SCALE_DEGREE_MAP@page-57 -->

As long as I can, long as I can

Spend some time alone

As long as I can, long as I can

Be the man I am

The voice reaches its acoustic ceiling at the same moment the harmony reaches its home key.

"One More Year"

Lyric and Music

The verse progression moves through I, IV, and bVII in a repeating loop that never reaches the dominant chord as a resolution point. The D-flat major chord arrives where the B-flat dominant should arrive. The phrase settles there instead. The lyric describes a life pattern that also never reaches its expected resolution point.

Do you remember we were standing here a year ago?

Our minds were racing and time went slow

If there was trouble in the world, we didn't know

If we had a care, it didn't show

But now I worry our horizons bear nothing new

The harmonic suspension matches the temporal suspension. The bVII chord holds the phrase open the same way the lyric holds the

year open.

"Posthumous Forgiveness"

Lyric and Music

The song's harmonic language mirrors the lyric's central tension between unresolved grief and belated understanding. Parker places the **borrowed bVI chord** at the emotional peak of the arrangement. It is an E-flat major chord that arrives in a G major context as a minor-third drop from the tonic. The chord carries the weight of everything the father left unsaid.

And you could store an ocean in the holes

In any of the explanations that you gave

And while you still had time, you had a chance

But you decided to take all your sorrys to the grave

<!-- visual:SCALE_DEGREE_MAP@page-58 -->

```
Scale of G major

   G      A      B      C      D      E      F#     G
   1      2      3      4      5      6      7      1
```

<!-- /visual:SCALE_DEGREE_MAP@page-58 -->

The bVI chord stays in the key without resolving it. This is exactly the way the father's apologies stayed in the grave without reaching the son.
